University of
Pennsylvania

Dr. Tae Min
Hong

ATLAS
Experiment

Introduction

- Higgs, Higgs via vector boson fusion (VBF)
- ATLAS at LHC

Focus on similar final states

- VBF $H \rightarrow WW^*$ \rightarrow $e \mu$ $\nu_e \nu_\mu$
- VBF $H \rightarrow \tau\tau$ \rightarrow ℓh $\nu_\ell \nu_\tau \nu_\tau$

Missing E_T (MET)

Putting it together

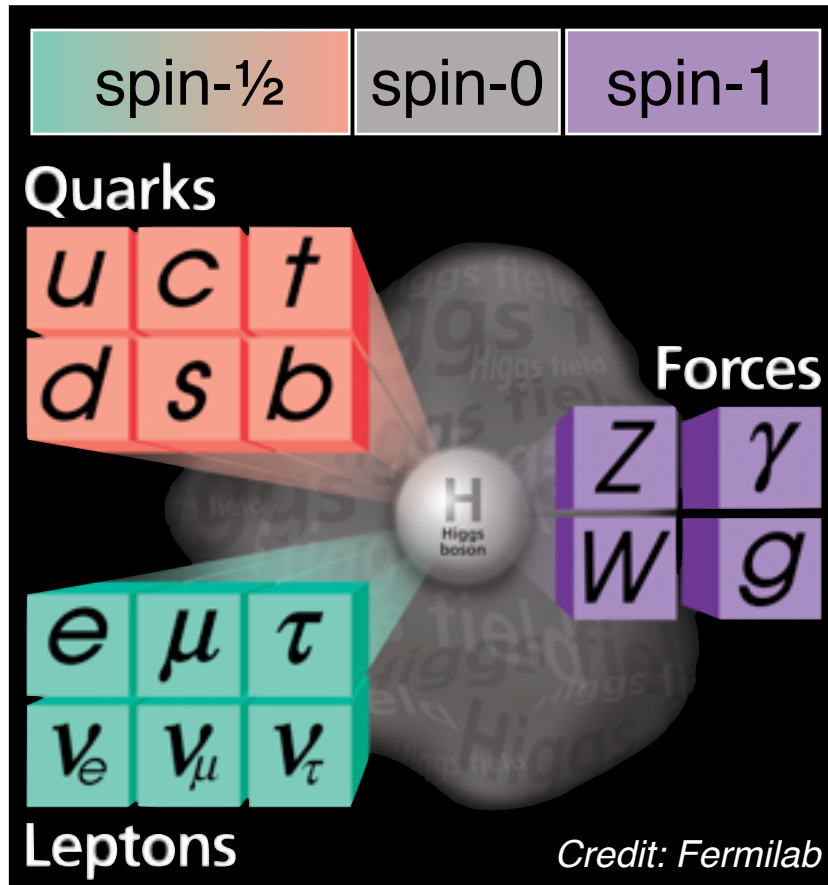

2 lepton-like objects

-
- References [a] HWW , ATLAS-CONF-2013-030 - Mar. 2013

[c] $H\tau\tau$, ATLAS-CONF-2013-108 - Dec. 2013

Higgs found at 125 GeV

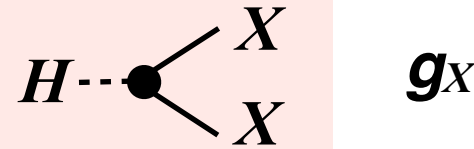

Allows fermion mass terms, restores electroweak symmetry

Hong

Divide into two groups

Tree relation for massive “X”

Loop relation for massless “Y”

Higgs boson theory - all true?

Higgs boson theory

Hong

Massive M

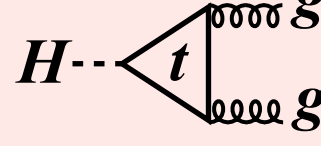

Fermions $F \equiv q, \ell$

$$g_F \propto -\frac{M_F}{v_{\text{ev}}}$$

Massless

Gluon g

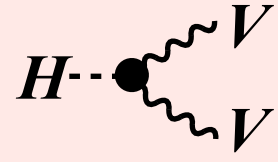

Beyond scope of talk

Higgs mass stabilization

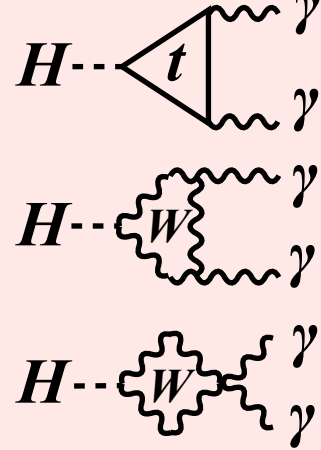

Vector bosons $V \equiv W, Z$

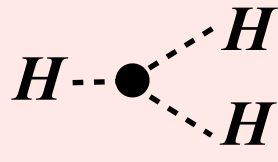

$$g_V \propto +2 \frac{(M_V)^2}{v_{\text{ev}}}$$

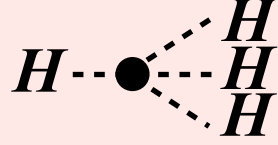

Photon γ

Higgs self-interaction

$$g_{2H} \propto -3 \frac{(M_H)^2}{v_{\text{ev}}}$$

$$g_{3H} \propto -3 \frac{(M_H)^2}{v_{\text{ev}}^2}$$

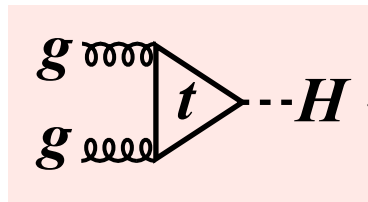

Lots to probe experimentally at the LHC.

What's measured

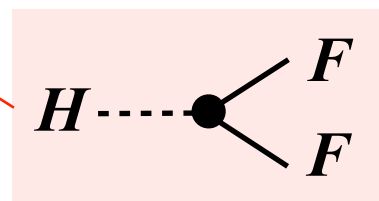

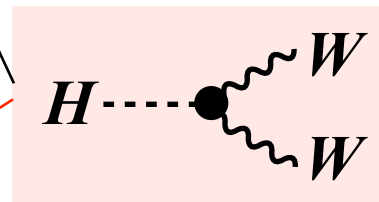

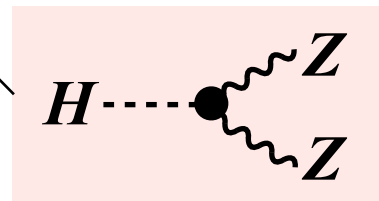

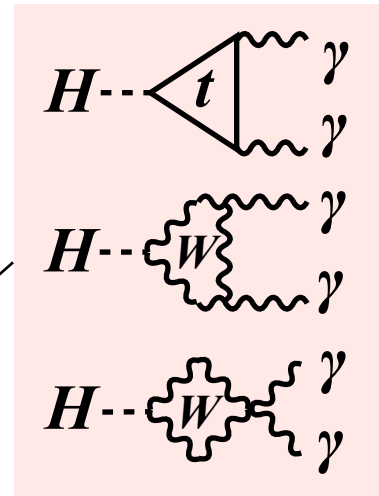

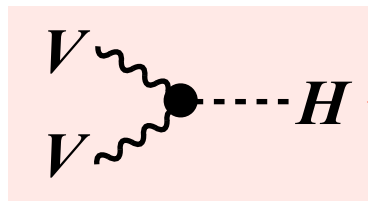

Higgs productions Higgs decays

Gluon-Gluon Fusion (ggF), dominant at LHC

Vector Boson Fusion (VBF), sub-dominant

Discovered Higgs with ggF production with
 $ggF \rightarrow H \rightarrow \text{bosons}$

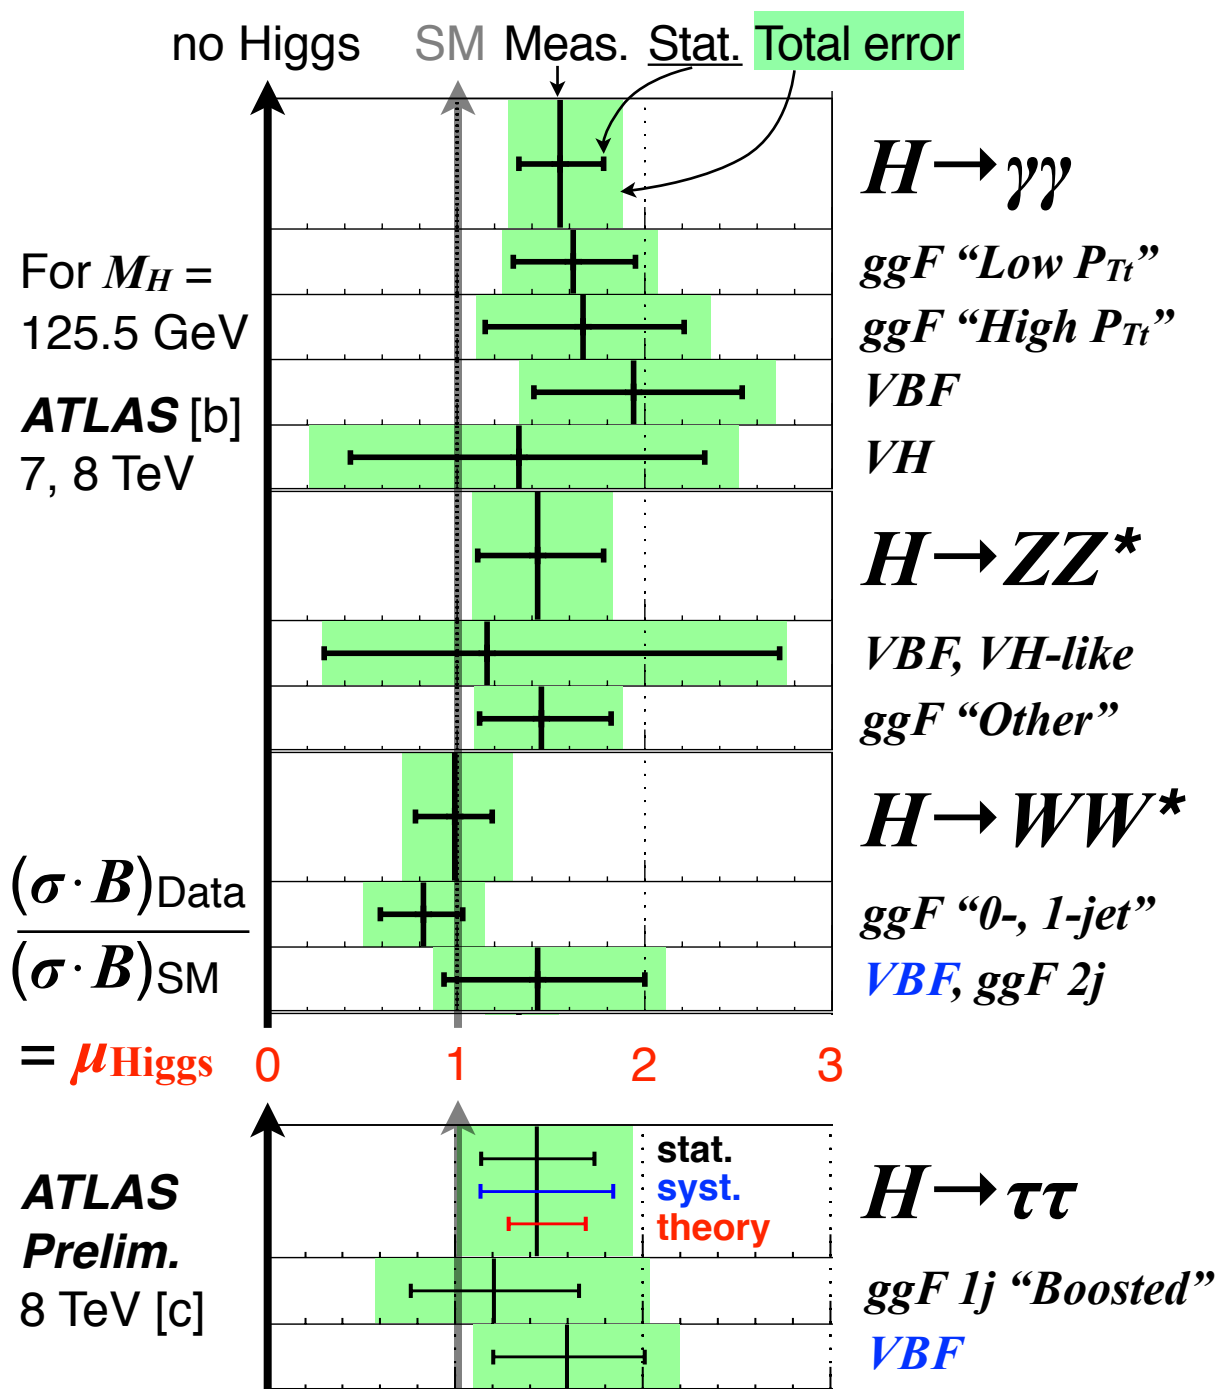

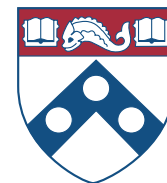

Now have evidence of VBF production with
 $VBF \rightarrow H \rightarrow \text{bosons}$

Only depends on g_V

Best direct constraint on g_F

ATLAS Higgs summary

Hong

I describe two analyses

Why VBF HWW

- I worked on it
- Best g_V , VBF HWW 2.5σ

Why VBF $H\tau\tau$

- Penn student work
- Direct g_F , $H\tau\tau$ 4.1σ (Dec.)

Important now, also Run-2

	ggF,	VBF
WW^*	yes	better S/B
$\tau\tau$	good	best

Analysis similarities

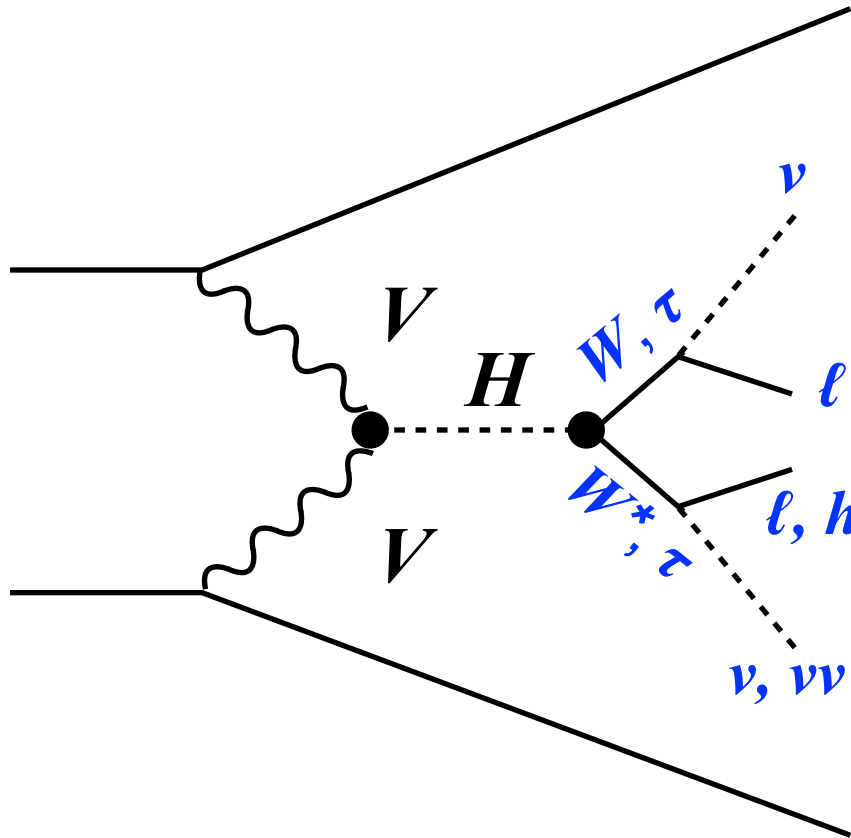

VBF $H \rightarrow WW^* \rightarrow e\mu$, VBF $H \rightarrow \tau\tau \rightarrow \ell h$

Hong

Tag production

Tag decay

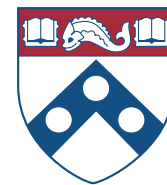

Two jets, two “leptons,” *MET*

Analysis similarities

VBF $H \rightarrow WW^* \rightarrow e\mu$, VBF $H \rightarrow \tau\tau \rightarrow \ell h$

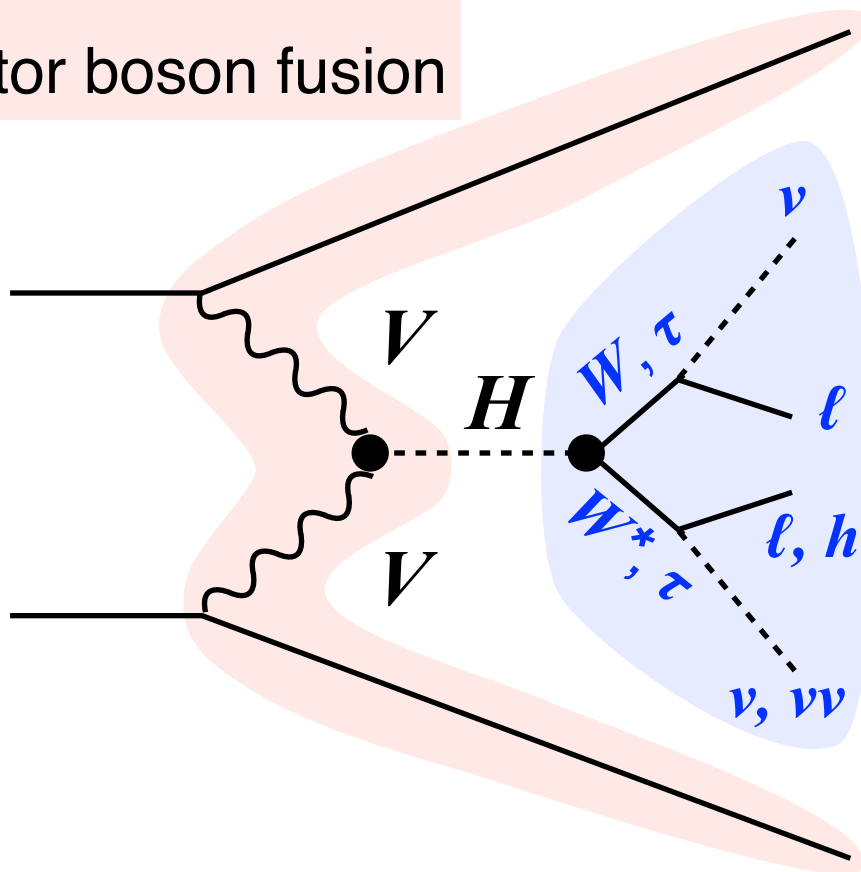

Hong

Tag production

Same

- Vector boson fusion

Tag decay

Similarities

- Trigger on e, μ
- 2 “leptons,” 2 neutrinos
- *MET*, no sharp mass peak

Differences

- Decay kinematics physics
- One $\tau \rightarrow \text{hadronic}$

Two jets, two “leptons,” *MET*

Vector-boson fusion

Cahn, Dawson, PLB 136 (1984) 196

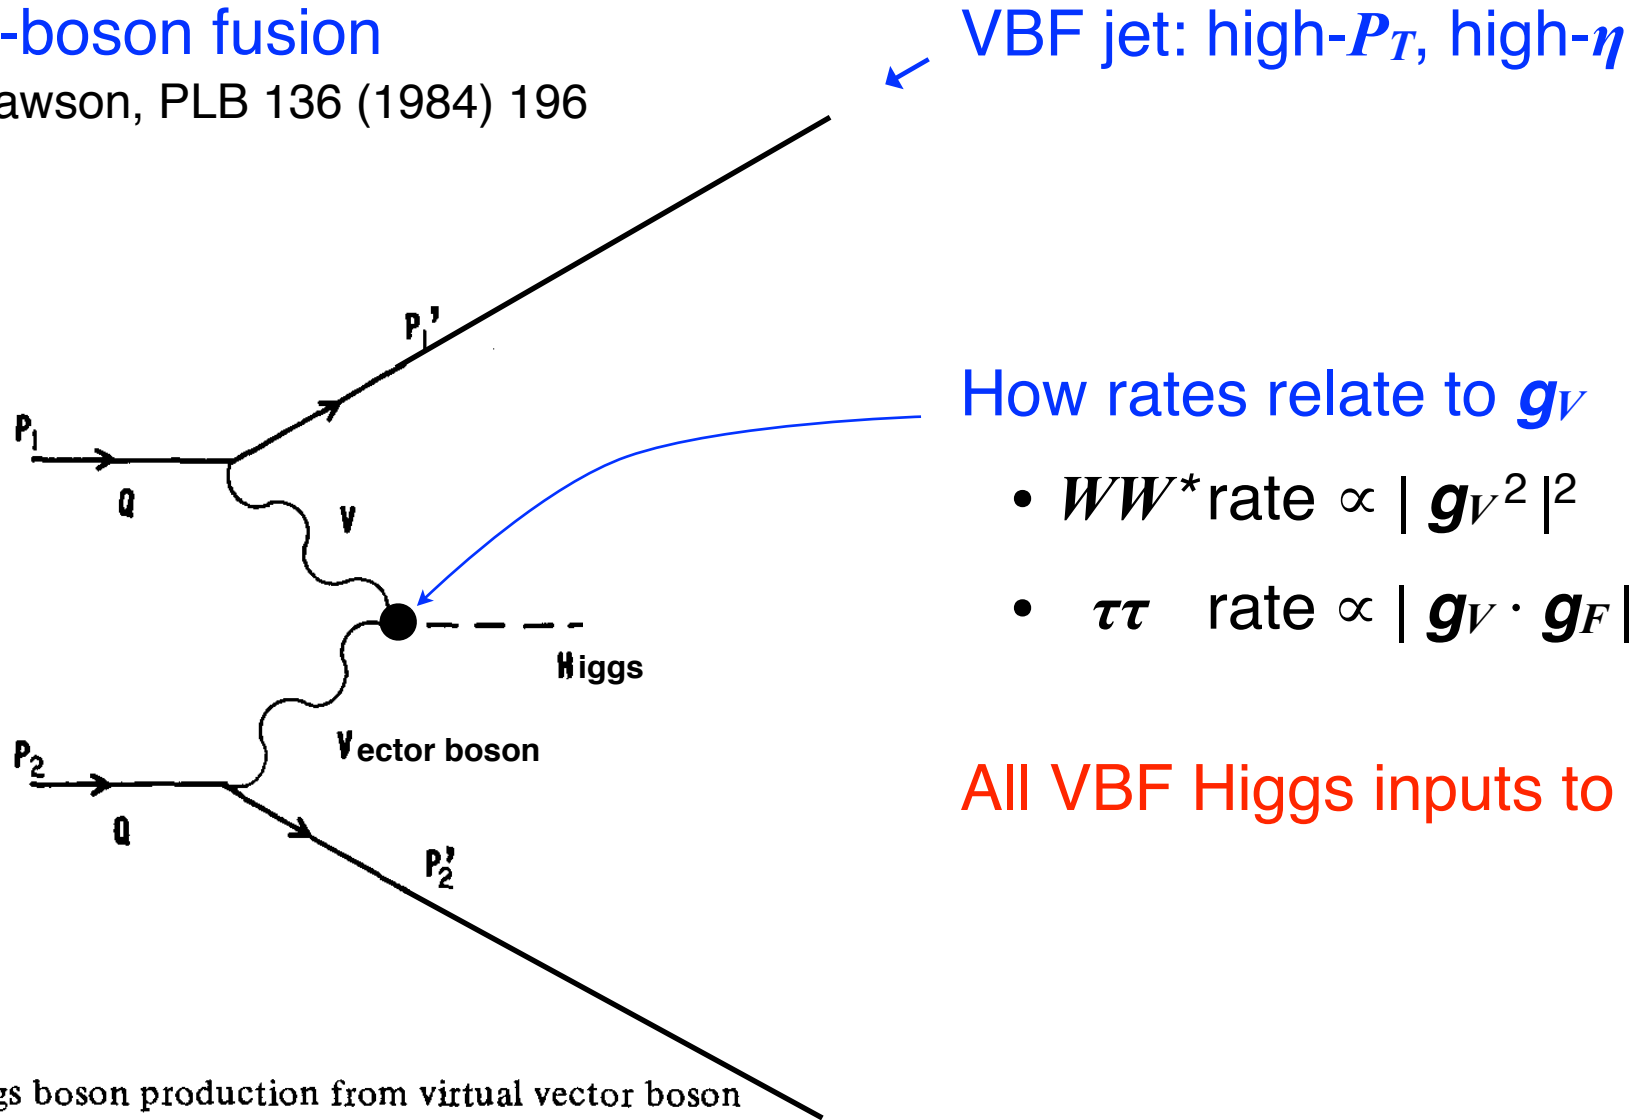

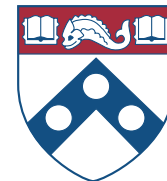

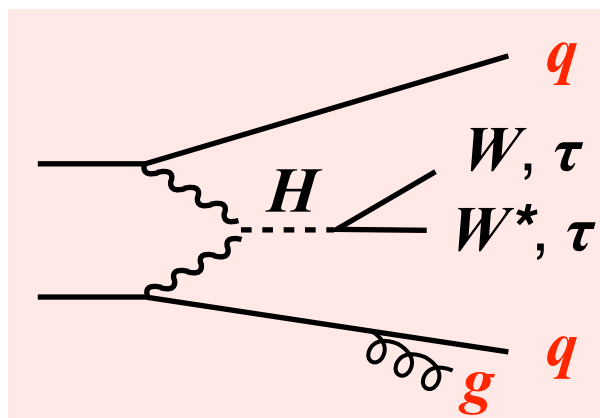

Fig. 1. Higgs boson production from virtual vector boson pairs ($V = W$ or Z). The initial state quark (or anti-quark) momenta are p_1 and p_2 and the corresponding final state momenta are p'_1 and p'_2 . The momenta of the virtual vector bosons are q_1 and q_2 .

Major backgrounds

Hong

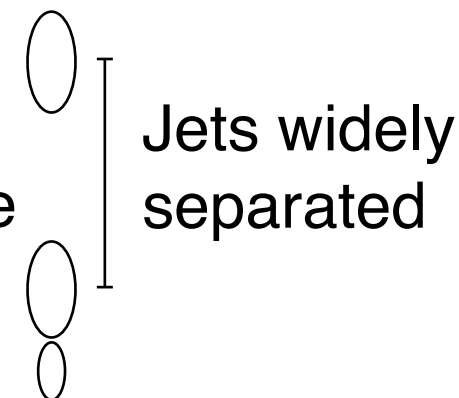

VBF Higgs

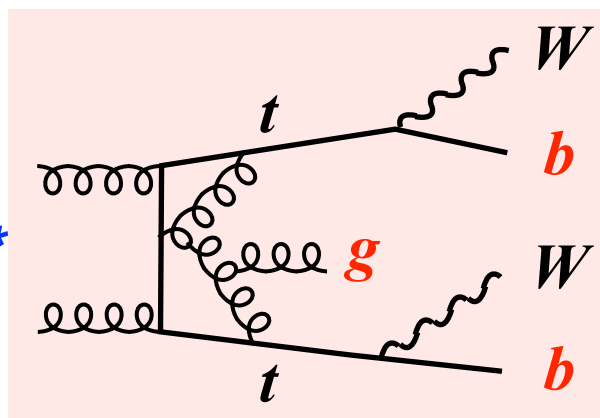

Energy deposits

Jets

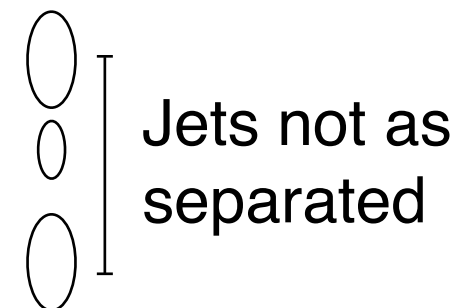

No color near H
No extra jets inside

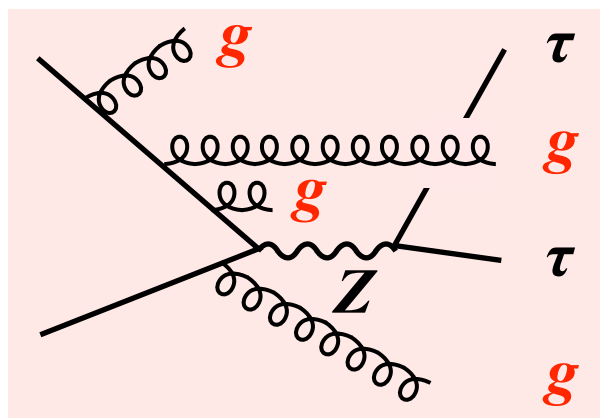

$t\bar{t}$ bar,
bkg. to WW^*

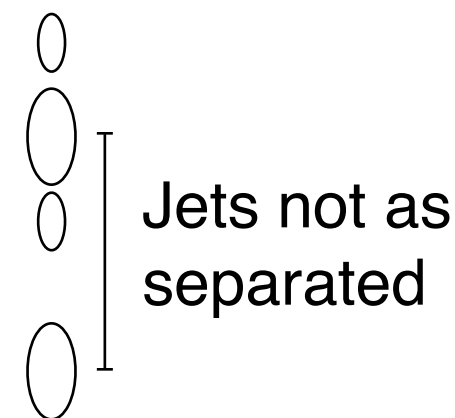

Hadronic activity

Z jets,
bkg. to $\tau\tau$

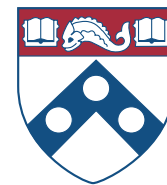

Hadronic activity

General feature of VBF production

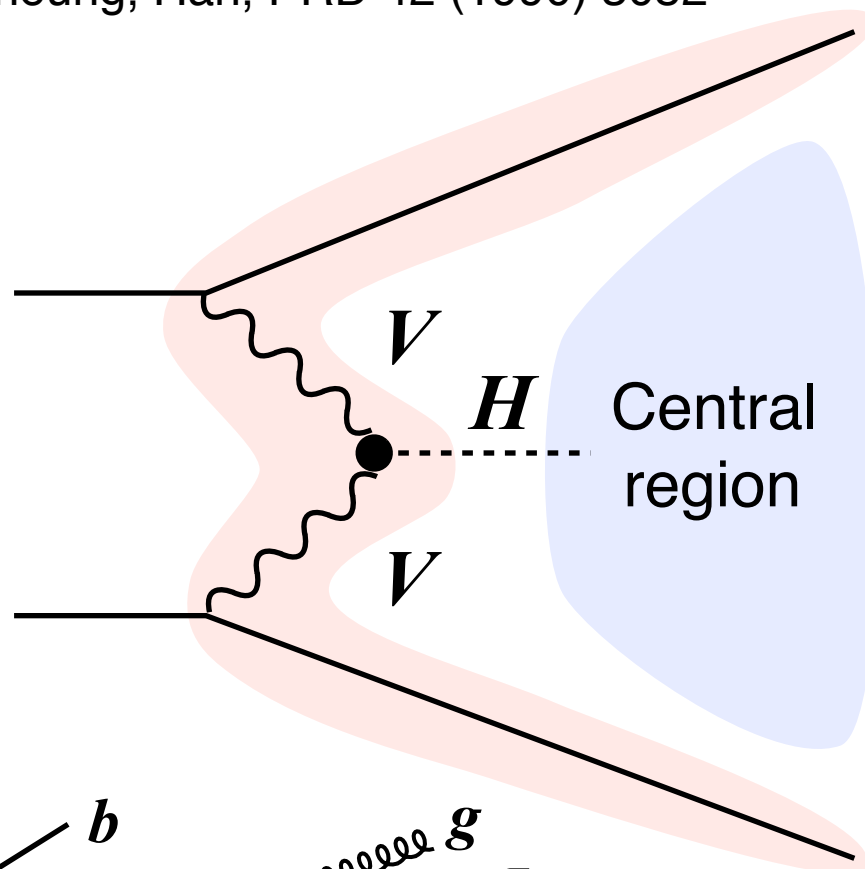

Hong

VBF “central region”

Zeppenfeld, Rainwater, PRD 60 (1999) 113004

Barger, Cheung, Han, PRD 42 (1990) 3052

Why

- Vector bosons are colorless
- No color between jets

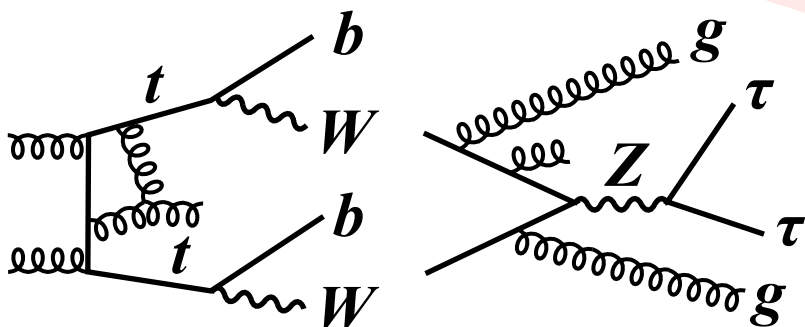

Consequence 1

- Less hadronic activity between jets in VBF

Consequence 2

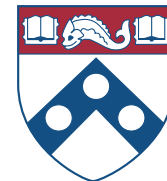

- Higgs decay daughters between jets in VBF

Effective in rejecting non-VBF

VBF jets

Hong

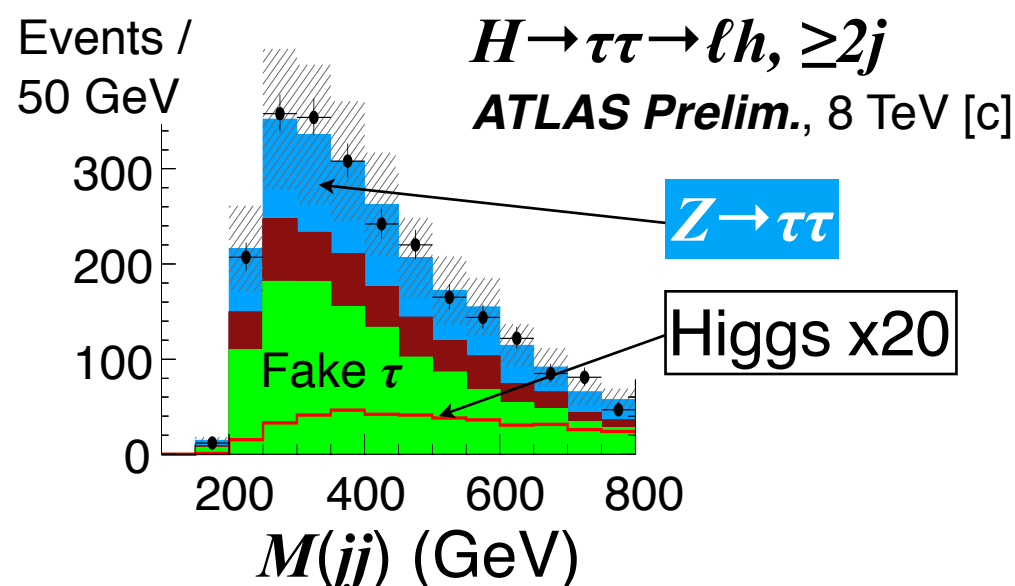

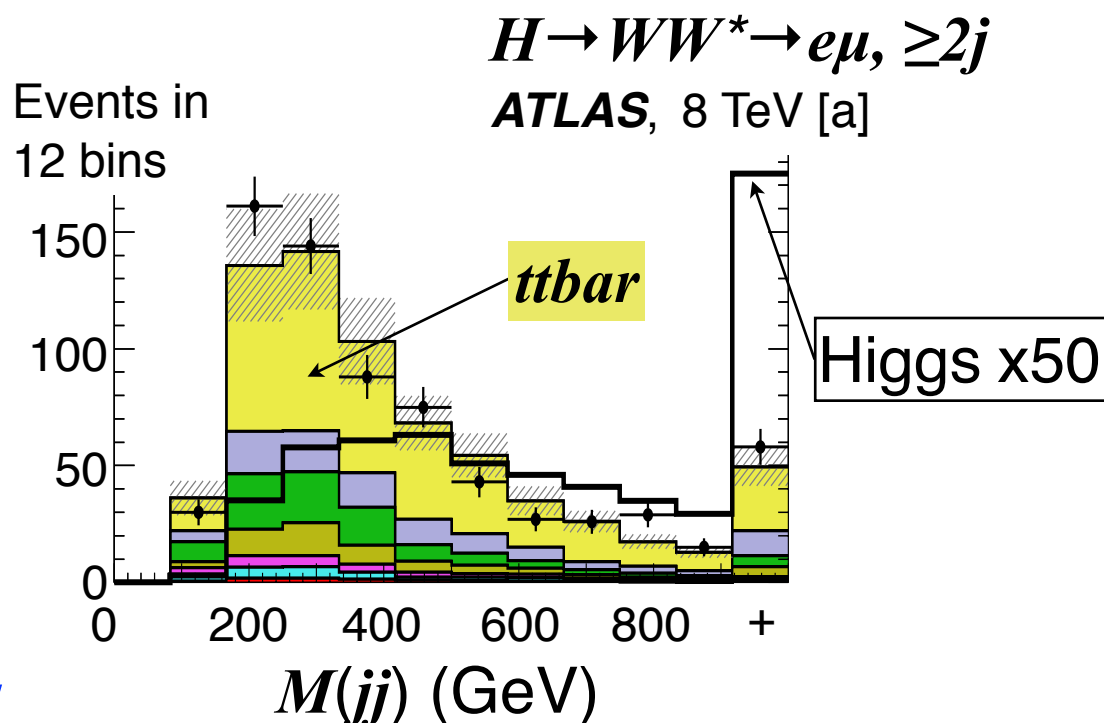

Two highest- P_T jets separated by $\Delta\eta$

Physics of jj invariant mass

- More powerful than $\Delta\eta$ alone
- $M(jj) \approx \sqrt{P_{T1} \cdot P_{T2} \cdot e^{\Delta\eta}}$
 $\sim \langle P_{T, jet} \rangle e^{\Delta\eta/2}$
- Example: $40 \cdot e^{3/2} = 180$ GeV

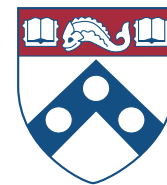

VBF has high value, non-VBF low

$M(jj)$ great v. all backgrounds

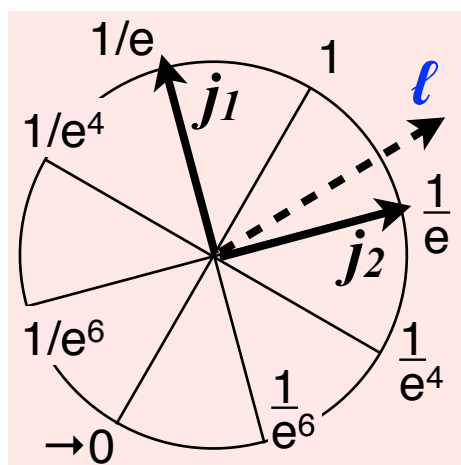

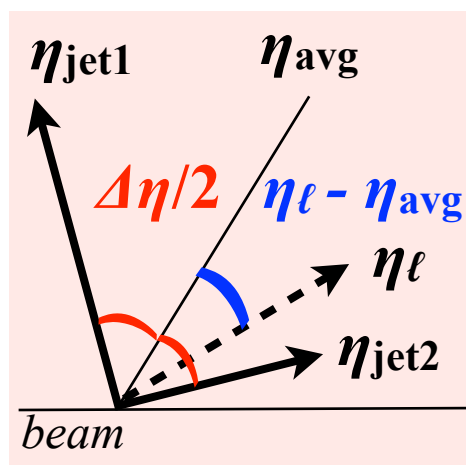

VBF central region in η

Hong

Quantify if object is in the central region

- Consider “centrality” of object w.r.t. VBF jets
- Example here takes lepton, but same for all

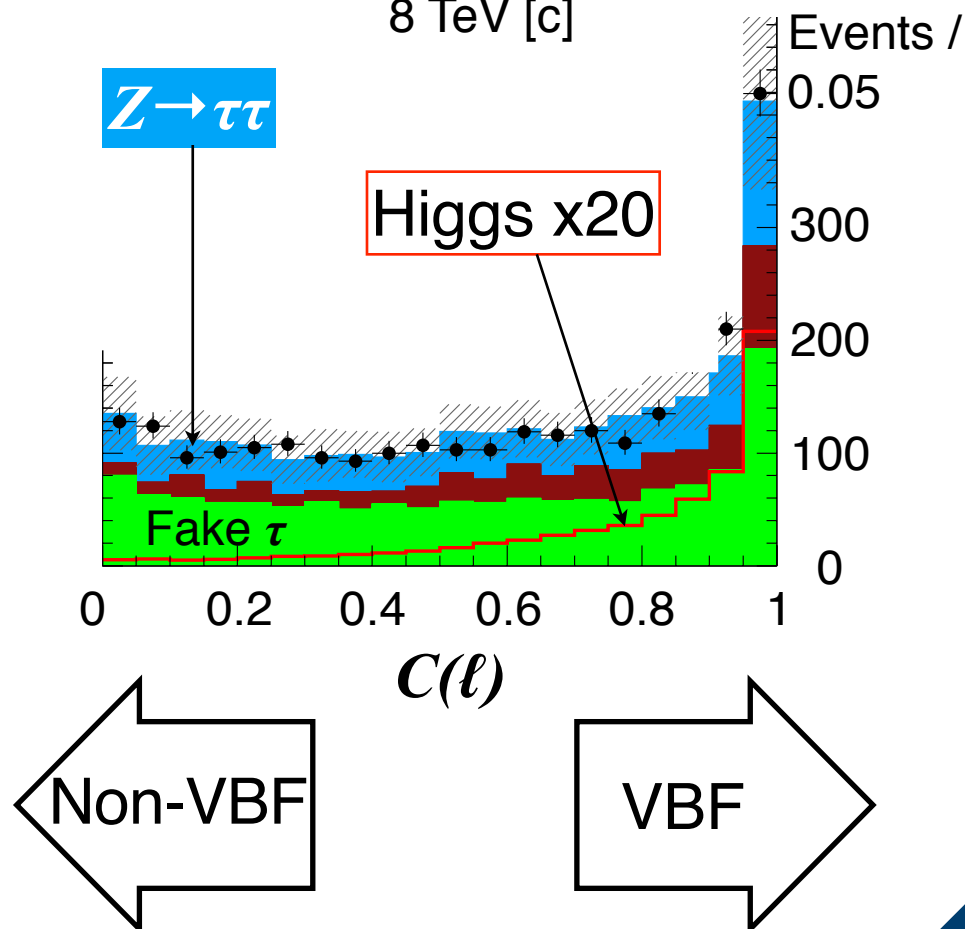

ℓ in between
jets or not?

$$C(\ell) \equiv e^{-\left| \frac{\eta_\ell - \eta_{\text{avg}}}{\Delta\eta/2} \right|^2}$$

$H \rightarrow \tau\tau \rightarrow \ell h \geq 2j$

ATLAS Prelim.

8 TeV [c]

Introduction

- Higgs via VBF
→ ATLAS at LHC

Focus on similar final states

- VBF $H \rightarrow WW^*$ → $e \mu$ $\nu_e \nu_\mu$
- VBF $H \rightarrow \tau\tau$ → ℓh $\nu_\ell \nu_\tau \nu_\tau$

Missing E_T (MET)

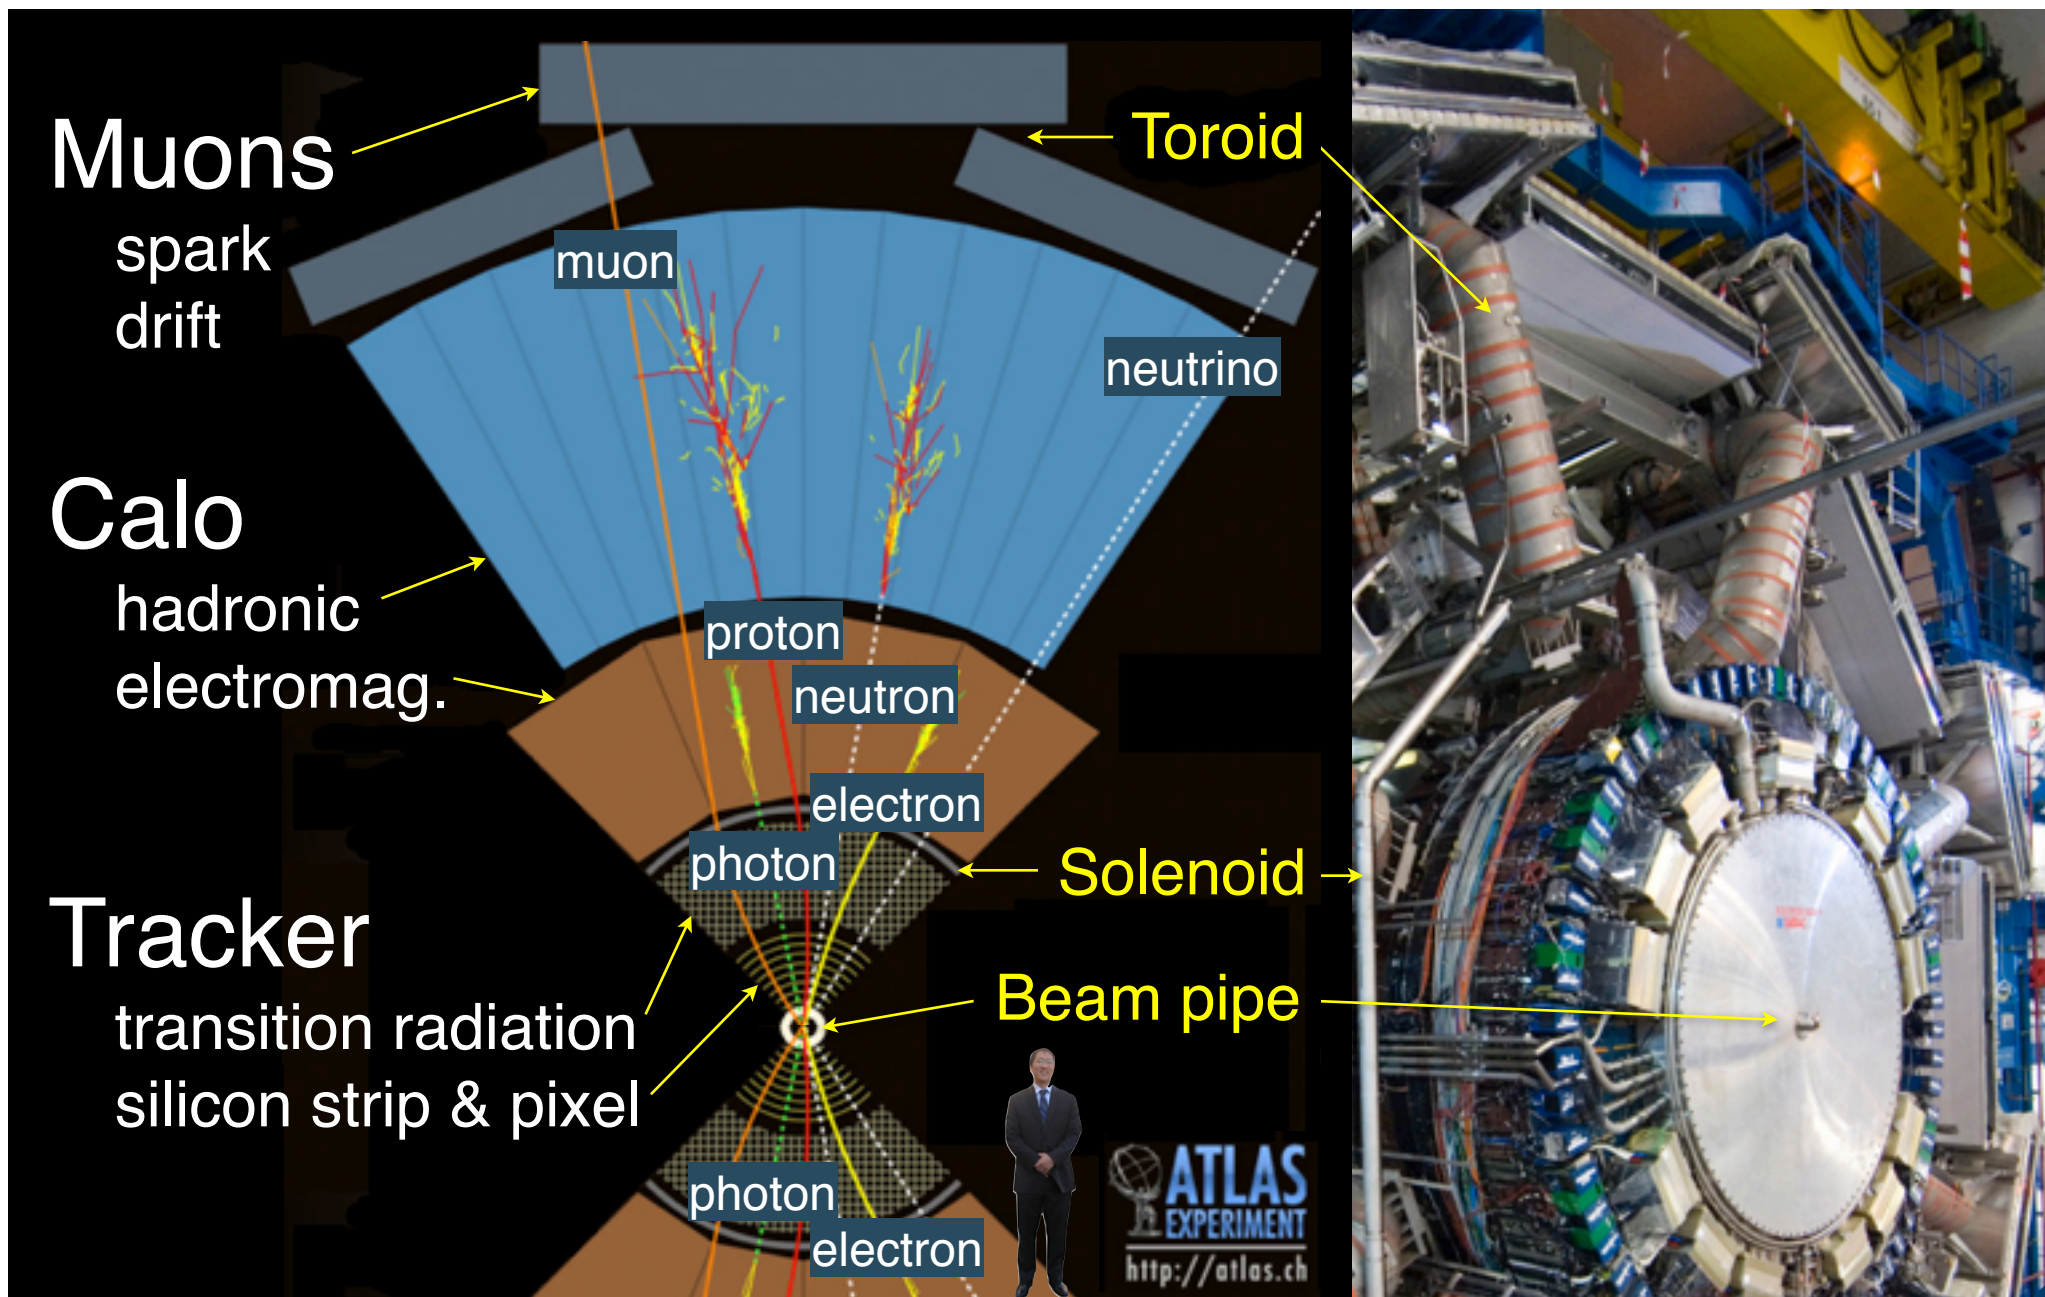

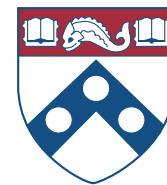

Putting it together

2 lepton-like objects

ATLAS detector

2 magnets, 3 sub-detector groups

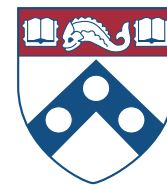

Hong

ATLAS η coverage

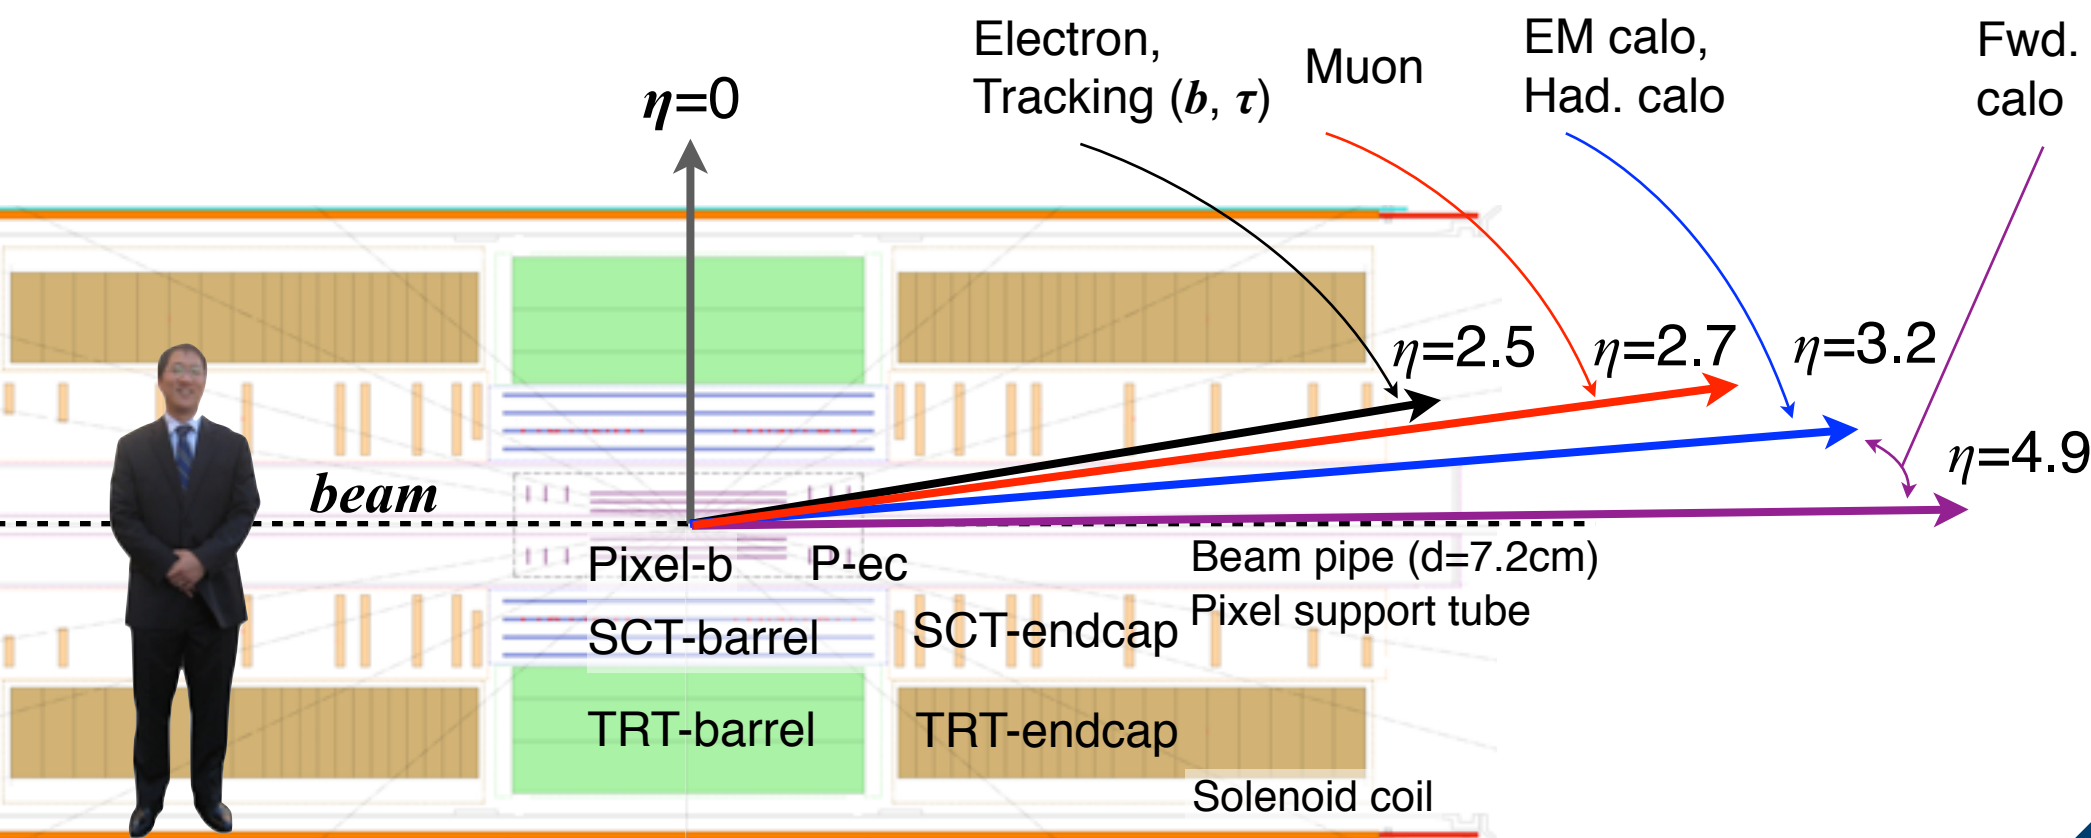

Shows tracker “inner detector”

Hong

Coverage important for analyses

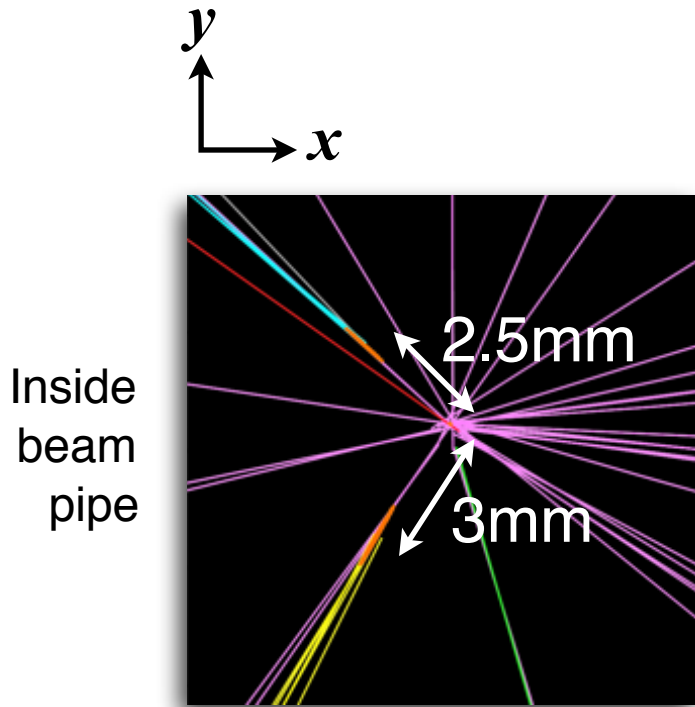

- Lepton up to ~ 2.6
- Jet up to 4.5 \rightarrow crucial to tag forward VBF jets
- Tracking up to 2.5 \rightarrow limitation for $t\bar{t}$ rejection

b quark jets

Long lifetime of 0.5mm, displaced vertices

Hong

Data $t\bar{t}$ with two tagged b

Why b important

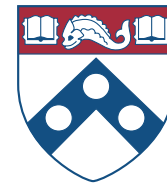

- Reject $t\bar{t}$ for $H \rightarrow WW^*$

Multivariate b identification

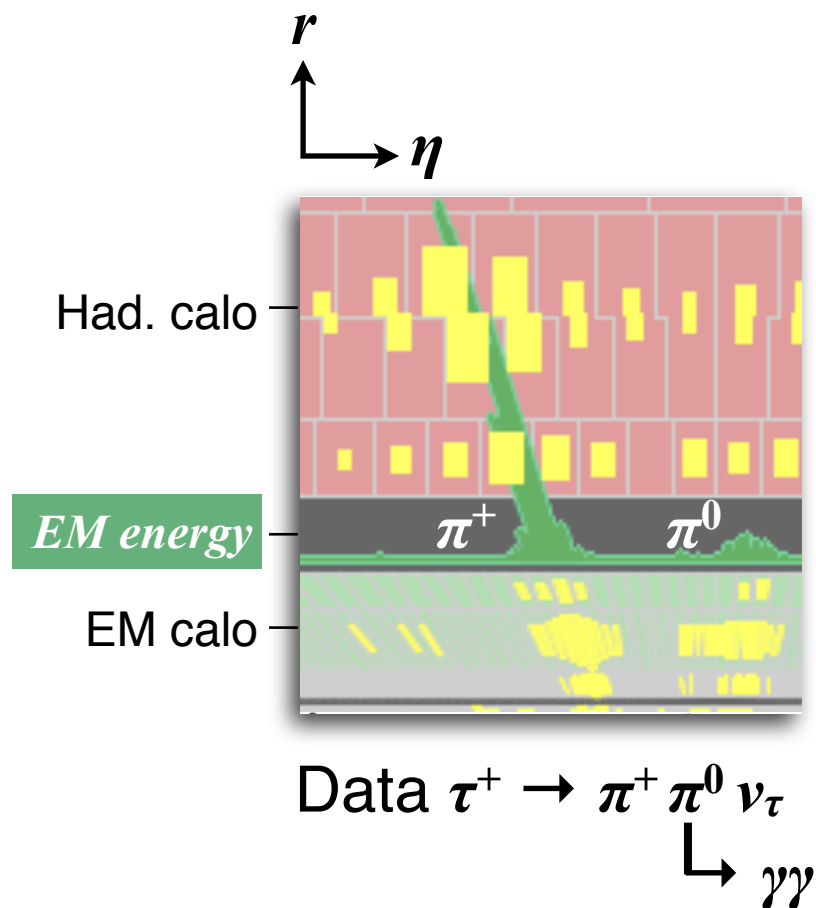

- 85% signal efficiency
- 10x rejection of light jets, 2.5x c jets

Hadronic τ “jets”

Hong

“Long” lifetime of 0.1mm, unique shower pattern

Why hadronic τ important

- $B(\tau \rightarrow h \nu_\tau) = 0.6$ for $H \rightarrow \tau\tau \rightarrow \ell h$

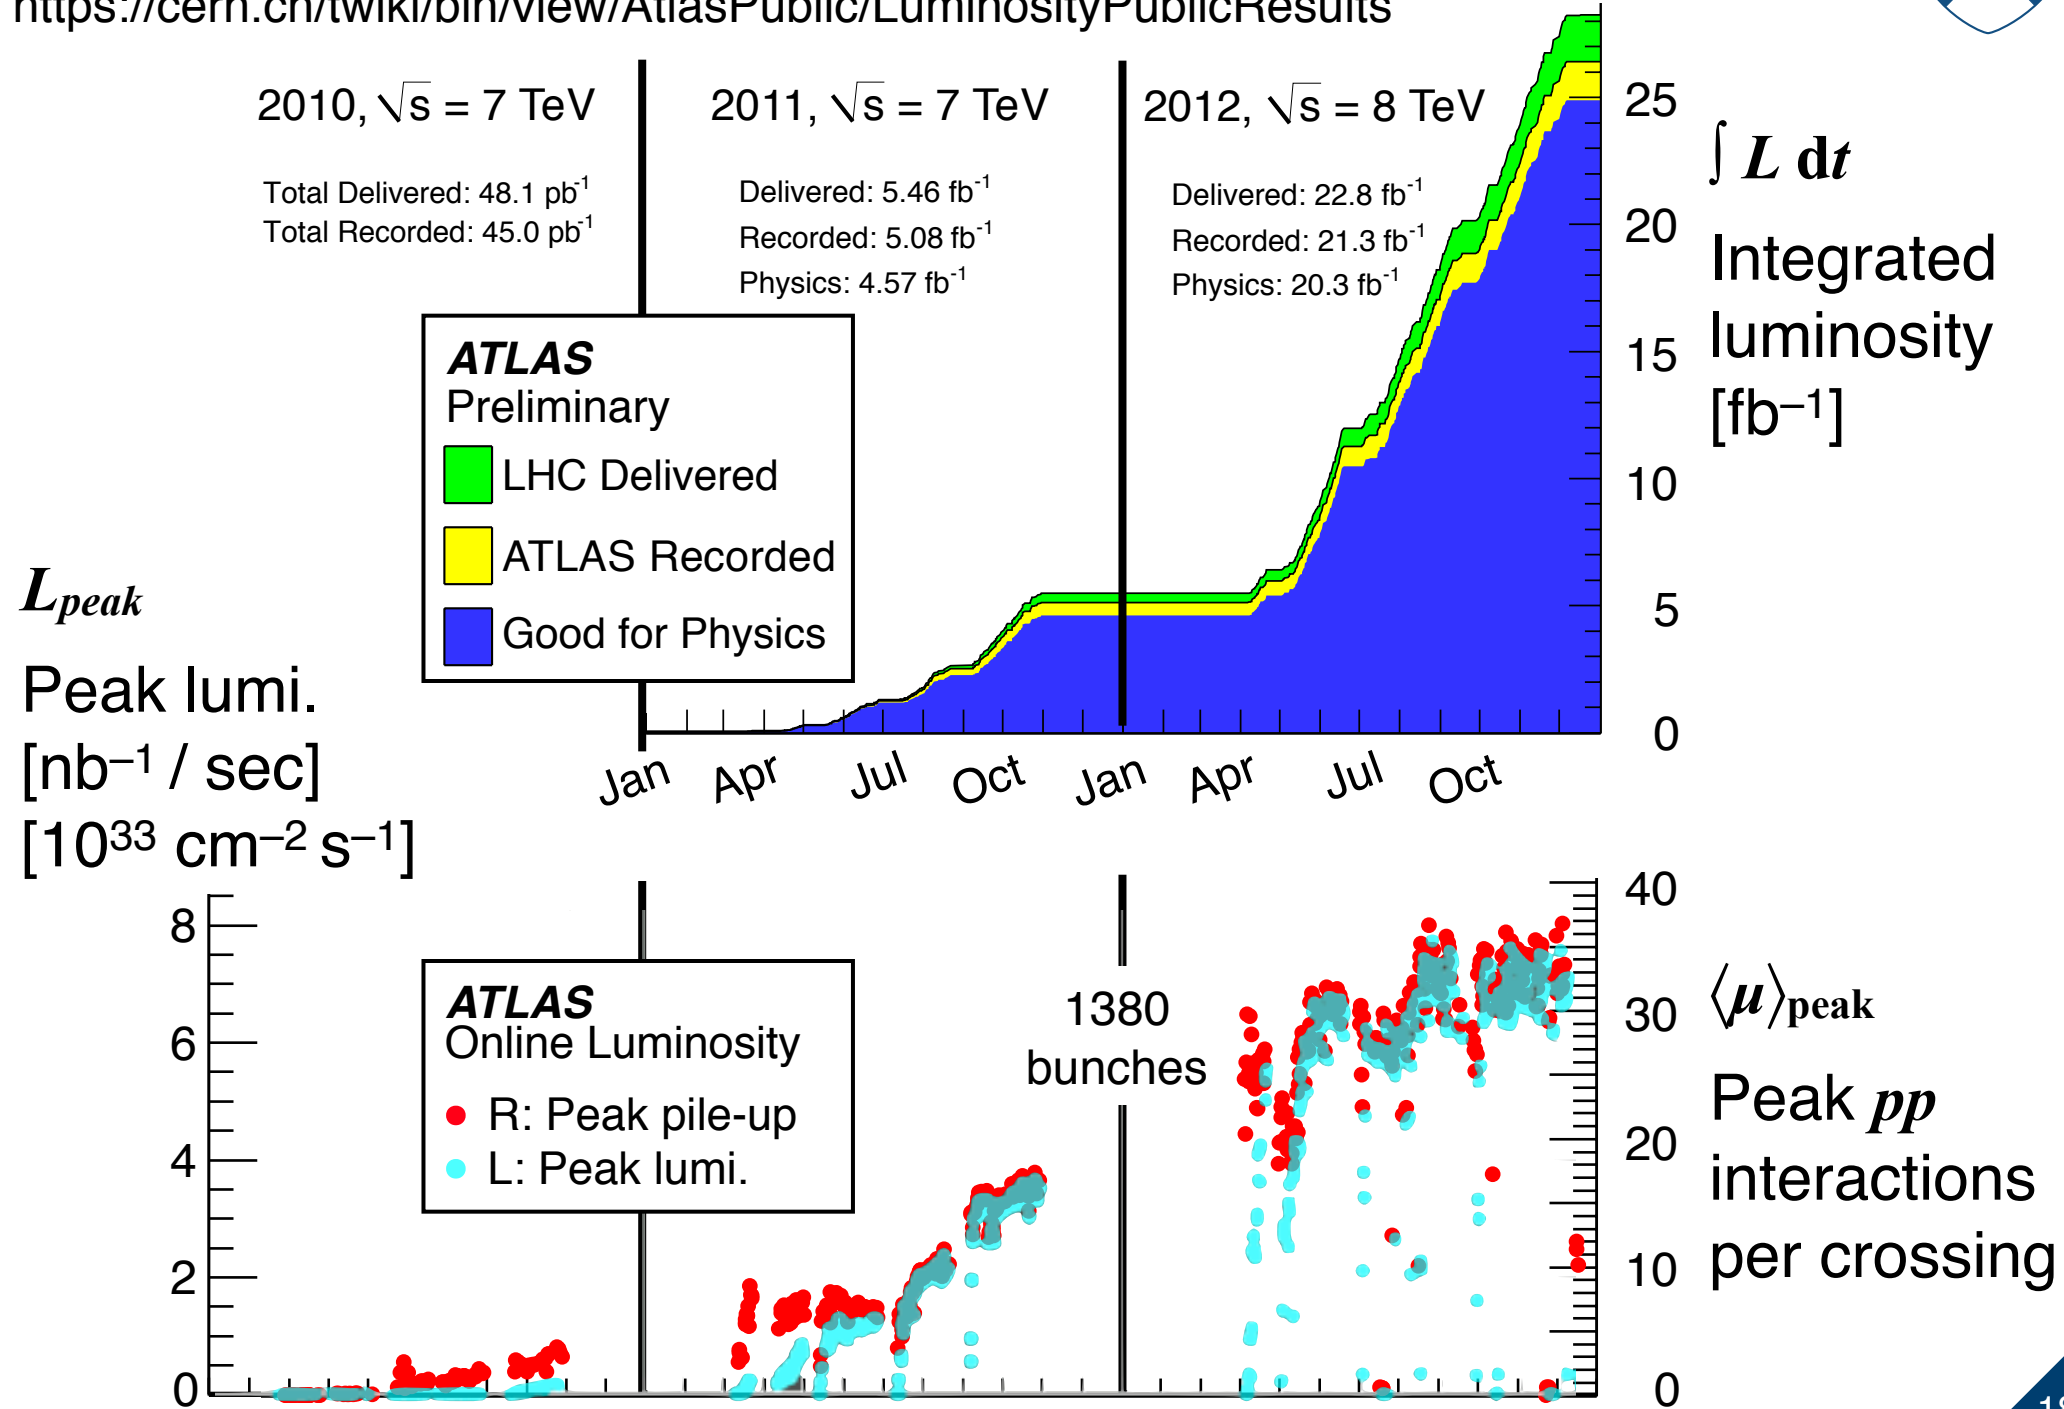

Multivariate τ identification

- 60% signal efficiency
- 20x rejection of light jets

ATLAS data

<https://cern.ch/twiki/bin/view/AtlasPublic/LuminosityPublicResults>

Hong

Event rates

Hong

Production rates for $L_{peak} = 8 \text{ nb}^{-1} / \text{sec}$

- $\sigma_{\text{inelastic}} = 60 \text{ mb} \rightarrow 5 \cdot 10^8 / \text{sec}$
- $\sigma_{Z \rightarrow \mu\mu} = 8 \text{ nb} \quad 6 / \text{sec}$
- $\sigma_{gg \rightarrow H} = 20 \text{ pb} \quad 0.2 / \text{sec}$
- $\sigma_{VV \rightarrow H} = 2 \text{ pb} \quad 0.02 / \text{sec}$

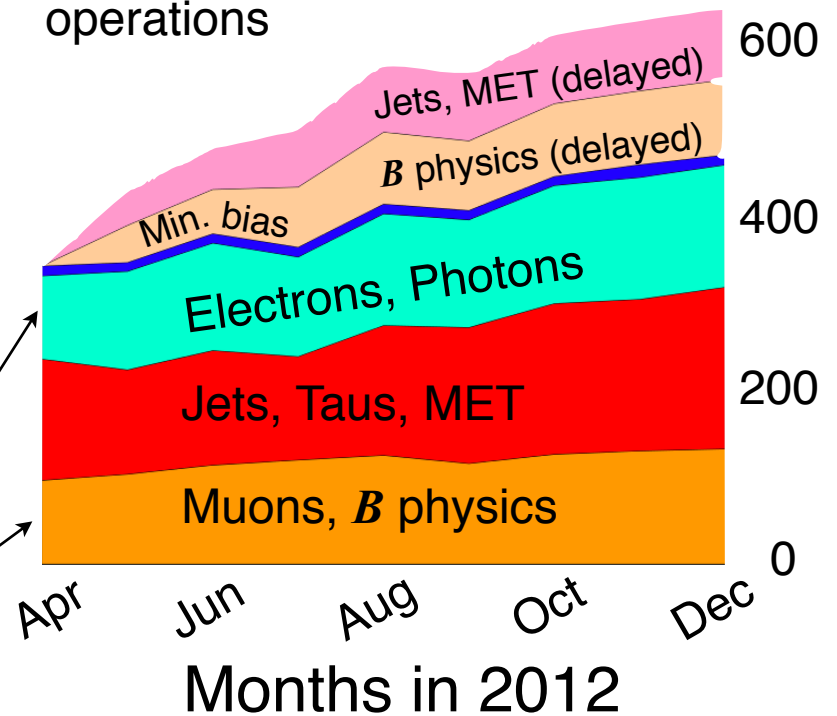

Need large reduction of background while saving Higgs events

Analysis triggers

- VBF $H \rightarrow WW^* \rightarrow e \mu \nu_e \nu_\mu$
- VBF $H \rightarrow \tau\tau \rightarrow \ell h \nu_\ell \nu_\tau \nu_\tau$
- Both trigger on $\ell = e, \mu > 24 \text{ GeV}$

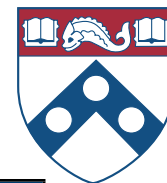

ATLAS
Trigger
operations

Triggered events
saved to disk (Hz)

How many Higgs did LHC make?

Hong

Formula

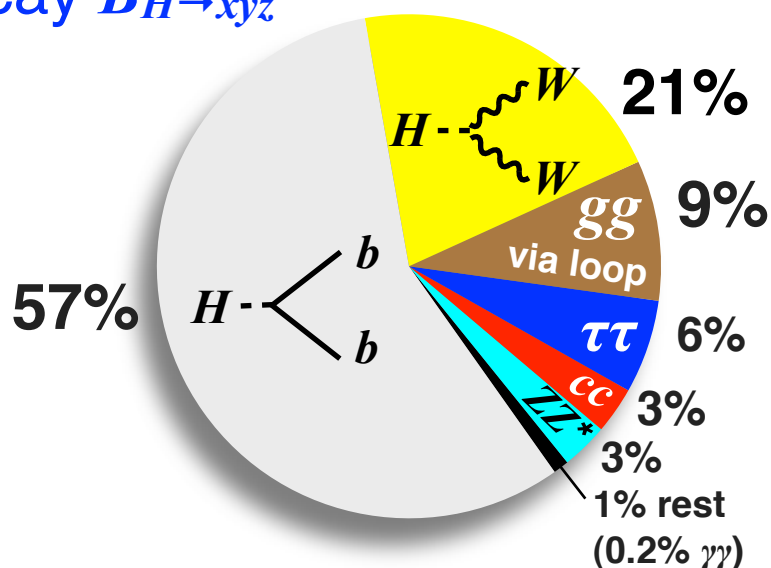

$$\bullet N_{pp \rightarrow H \rightarrow xyz} = L \cdot \sigma_{pp \rightarrow H} \cdot B_{H \rightarrow xyz}$$

Production $\sigma_{pp \rightarrow H}$

Heinmeyer et al., CERN-2013-004

- ggF theory uncertainty $\sim 10\%$
- VBF theory uncertainty $\sim 3\%$
- VH, ttH smaller cross-section

Decay $B_{H \rightarrow xyz}$

Diagram

ggF	VBF
L (8 TeV)	21 fb ⁻¹
$\sigma_{pp \rightarrow H}$	19,270 fb 1,580 fb
$N_{pp \rightarrow H}$	400k 33k

$O(1000)$ VBF Higgs in this talk

Introduction

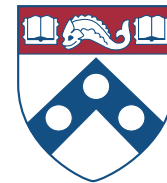

- Higgs via VBF
- ATLAS at LHC

Focus on similar final states

VBF $WW^* \rightarrow e\mu$

Hong

Analysis flowchart

- Trigger on ℓ mostly

Pre-sel.

- Require non- b jets with $\Delta\eta_{jj} \gtrsim 3$
- Require e, μ, MET

Already
discussed

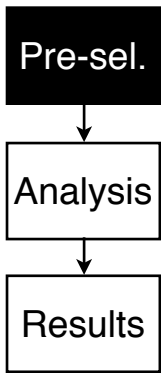

Analysis

- Select on VBF production properties
- Select on $H \rightarrow WW^*$ decay properties
- Background model validation

This
section

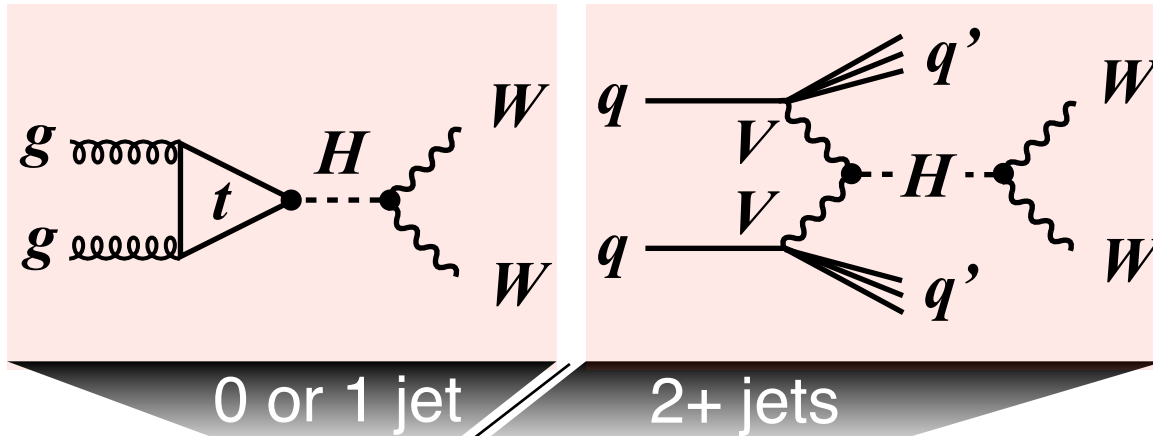

Results

- Fit $M_{T, \text{Higgs}}$ to get $\mu_{\text{Higgs, VBF}}$

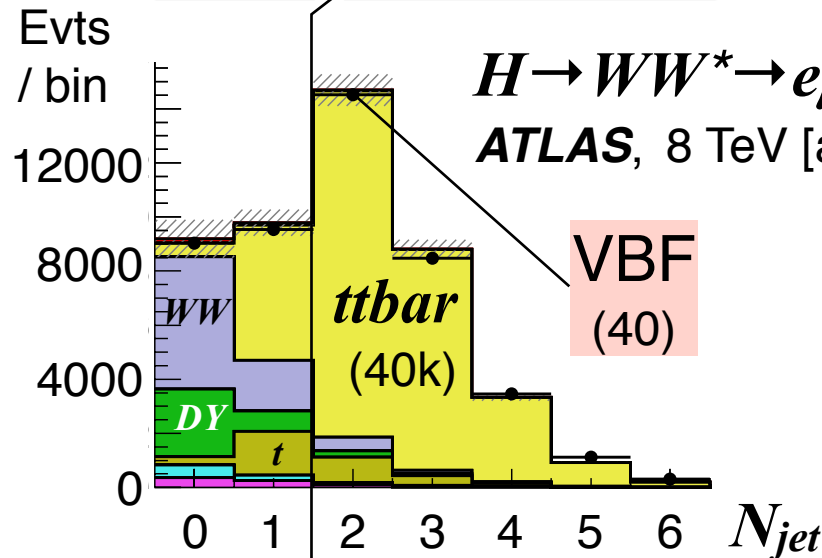

WW^* physics with N_{Jet}

- Separate ggF v. VBF by N_{Jet}

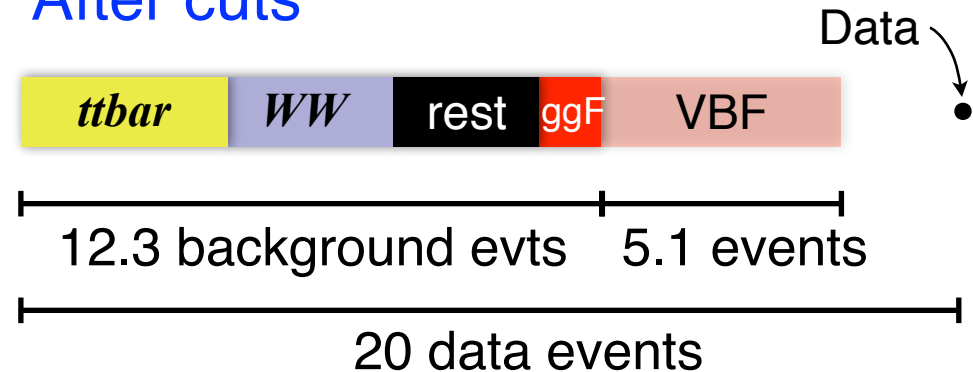

- Benefit by VBF rate $\propto |g_V|^4$
- Measuring $\pm 50\%$ rate translates to $\pm 11\%$ g_V

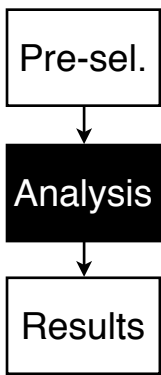

Before cuts (after pre-sel.)

After cuts

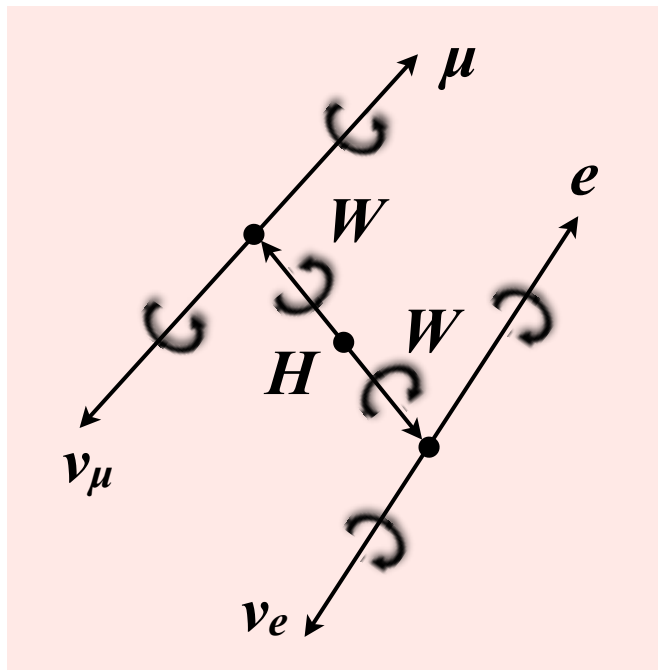

Two leptons, MET , jets (no b veto)

Great S/B

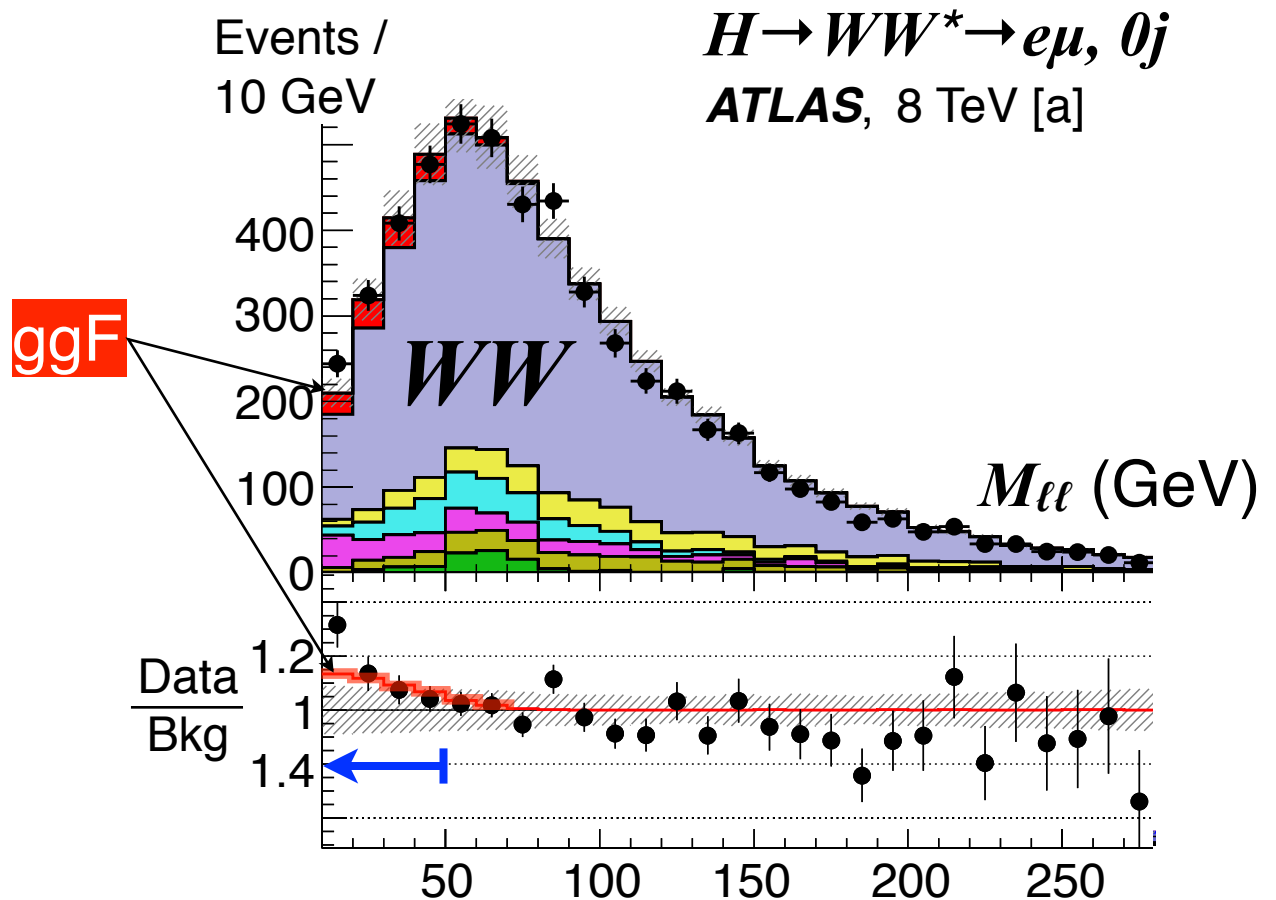

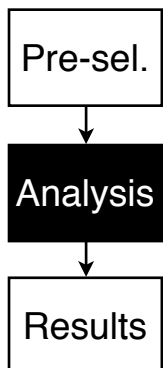

Physics with $\ell\ell$

- Higgs ($J=0$)
 - W decay violates parity
 - Spin conservation
- Collinear $\ell\ell$ → Low $M_{\ell\ell}$

Excess as expected

Physics with $\ell\ell$, MET

- Considered $\ell\ell$, now add MET
- Approximate mass with $M_{T,H}$
- Broad at ~ 30 GeV

$$M_{T,H} = \sqrt{(E_{T,H})^2 - (\vec{P}_{T,H})^2}$$

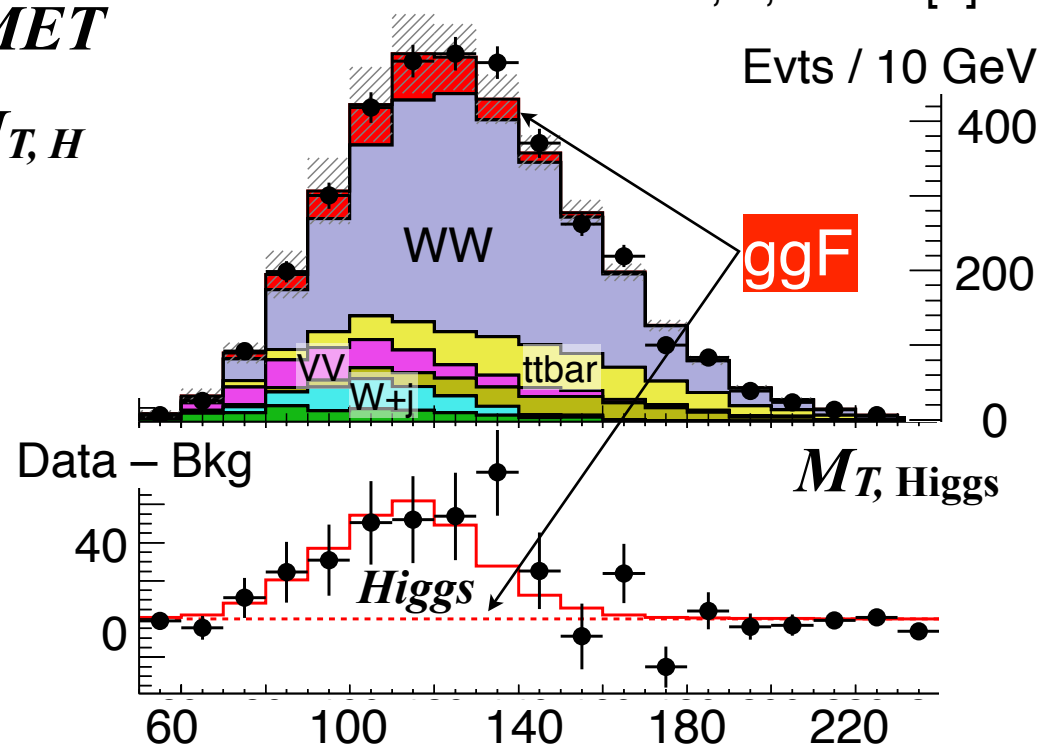

$$\vec{P}_{T,H} = \vec{P}_{T,\ell\ell} + \vec{MET}$$

$$E_{T,H} = E_{T,\ell\ell} + MET$$

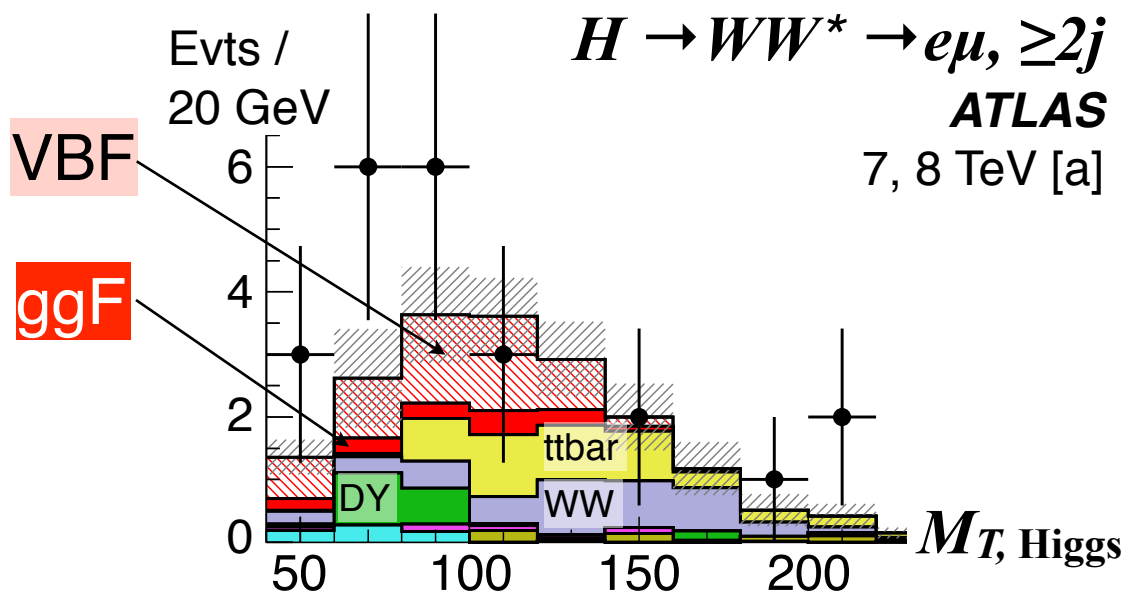

$$\sqrt{(\vec{P}_{T,\ell\ell})^2 + (M_{\ell\ell})^2}$$

Shape, normalization
consistent with Higgs at 125

$H \rightarrow WW^* \rightarrow e\mu, ee, \mu\mu, \leq 1j$
ATLAS, 7, 8 TeV [a]

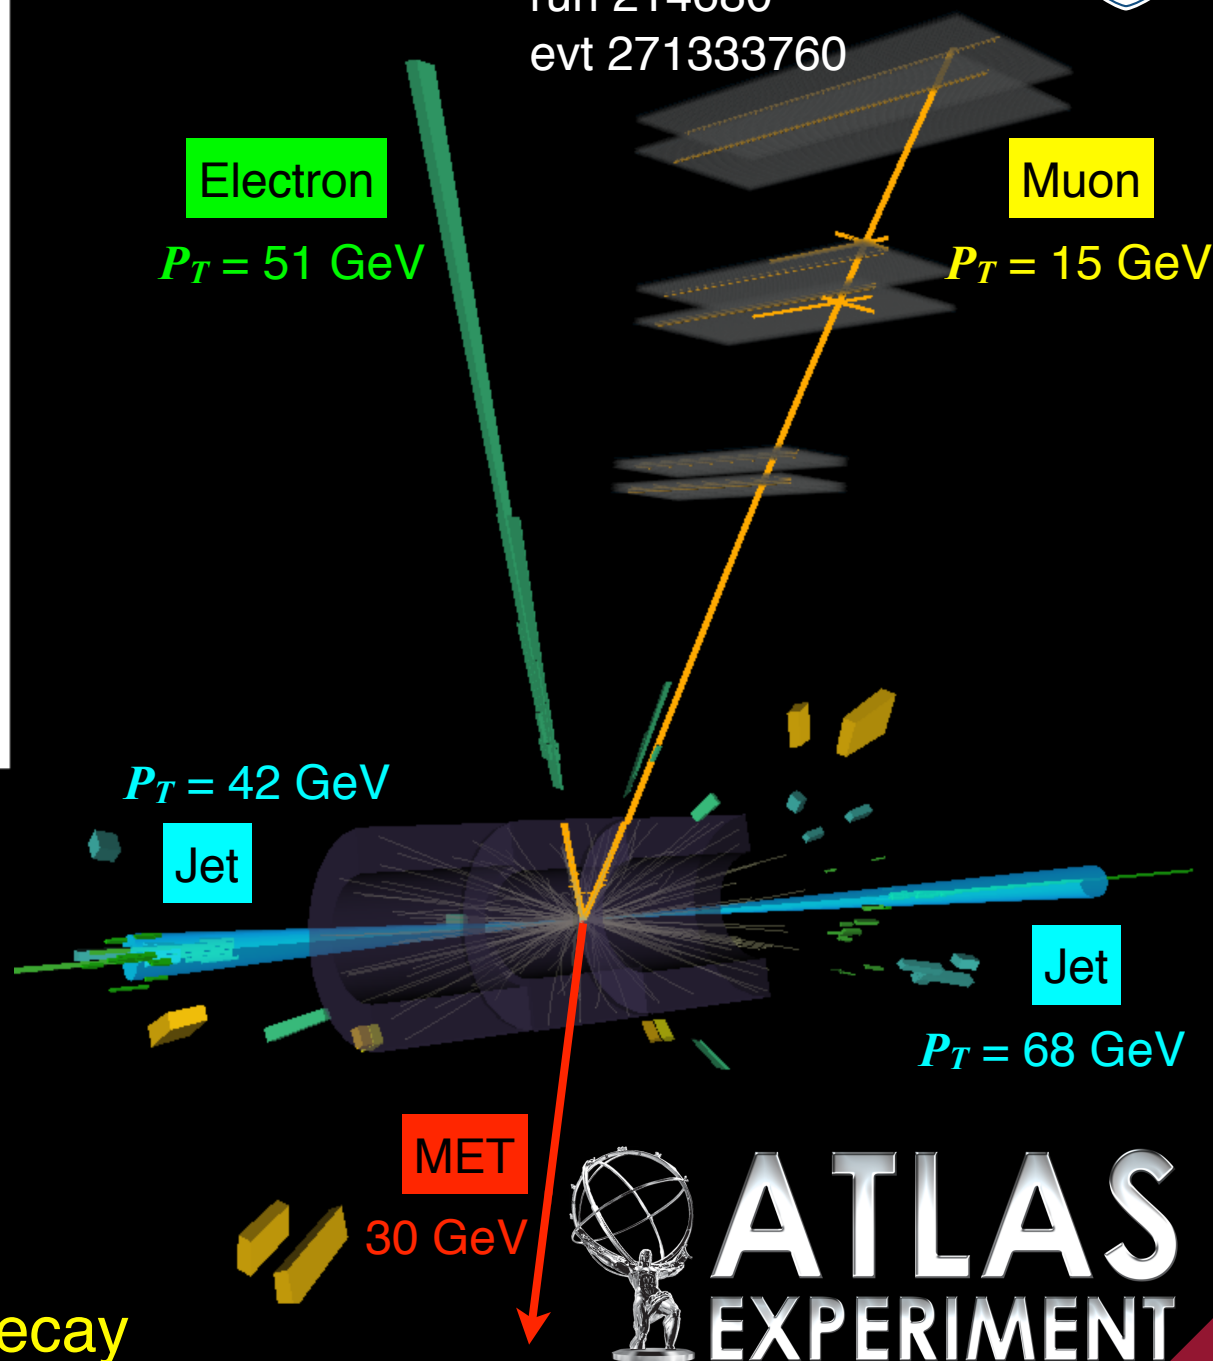

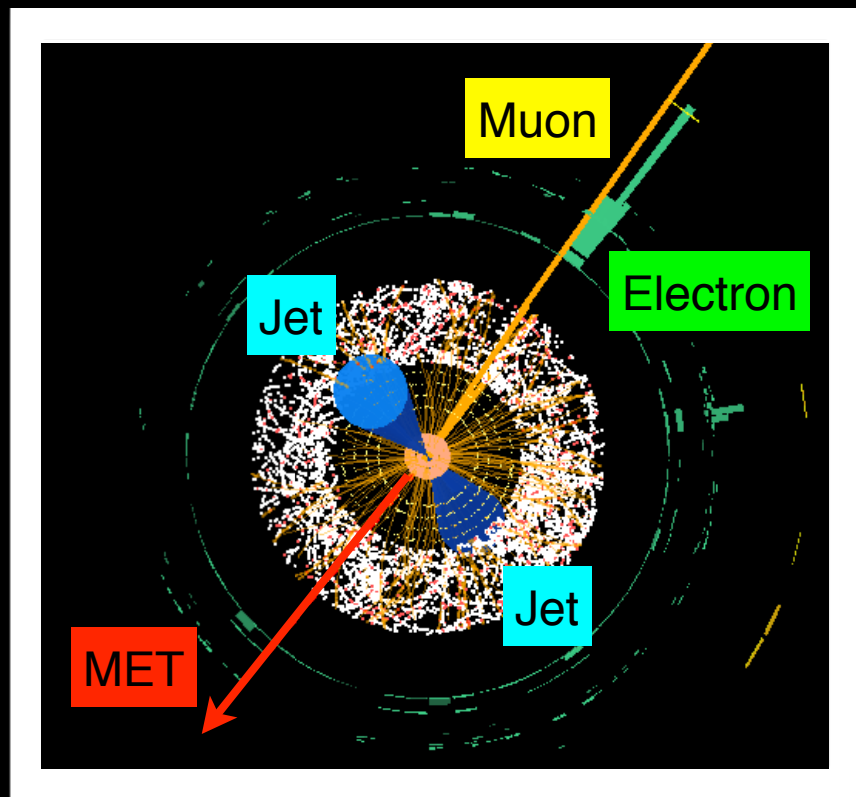

$H \rightarrow WW^* \rightarrow e\mu, \geq 2j$

Hong

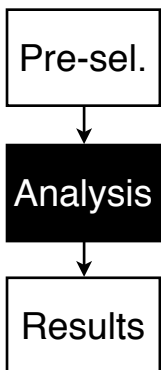

VBF ($\Delta\eta_{jj} = 6.6$)
 $M_{jj} = 1.5 \text{ TeV}$
HWW ($M_{e\mu} = 21 \text{ GeV}$)
 $M_{T,H} = 95 \text{ GeV}$
ttbar Jets not b -tagged

VBF-like in jj & Higgs-like in decay

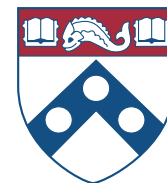

ATLAS
EXPERIMENT

$t\bar{t}b\bar{a}r \rightarrow WbWb$ background

Hong

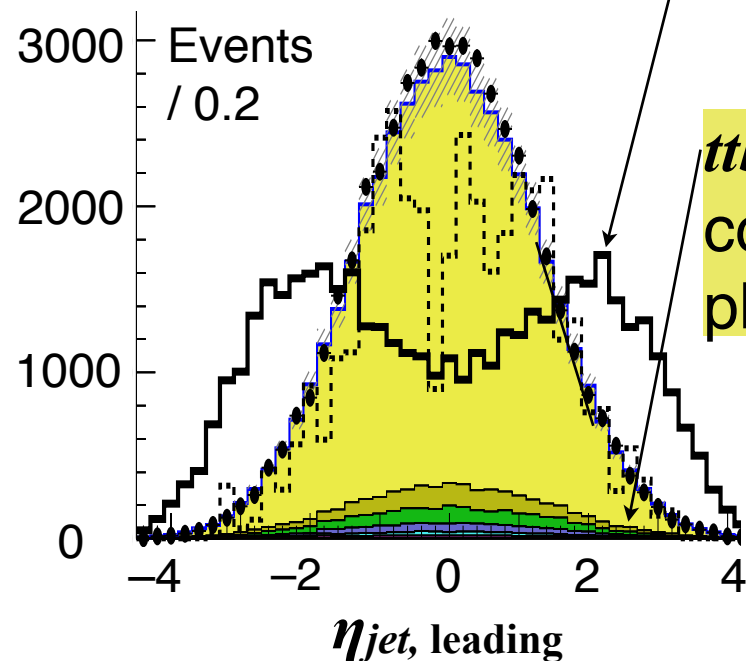

- VBF jets have large η , where no tracking

- In $t\bar{t}b\bar{a}r$ events, high M_{jj} selects one b , one non- b

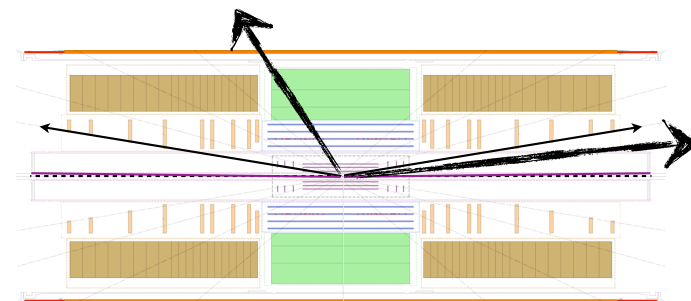

$H \rightarrow WW^* \rightarrow e\mu, \geq 2j$

ATLAS, 8 TeV [a]

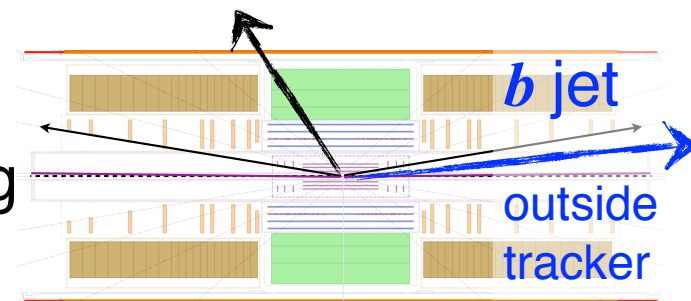

tracker can't b -tag outside tracker

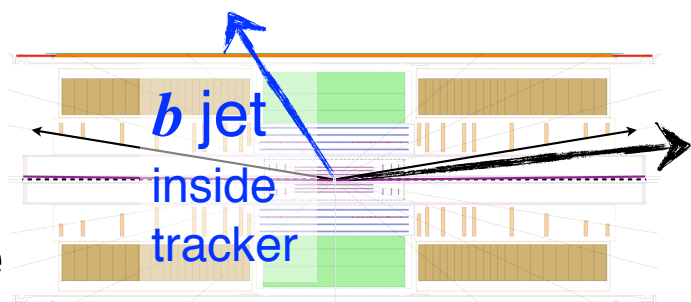

VBF Higgs

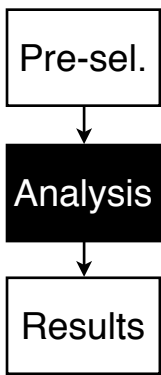

$t\bar{t}b\bar{a}r$ passing cuts

$t\bar{t}b\bar{a}r$ control sample

ttbar modeling difficulty

- Slide for experts

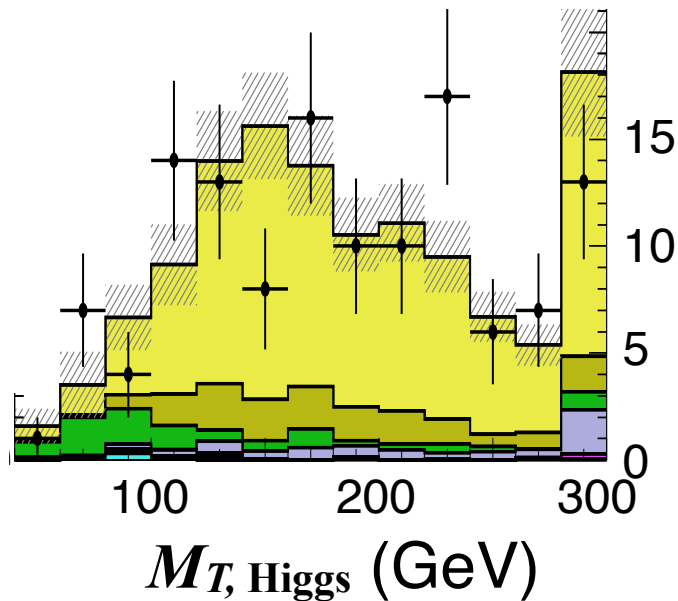

ttbar good $\ell\ell$ & MET modeling, but

ttbar control sample

$H \rightarrow WW^* \rightarrow e\mu, \geq 2j$

ATLAS, 8 TeV [a]

Events /
20 GeV

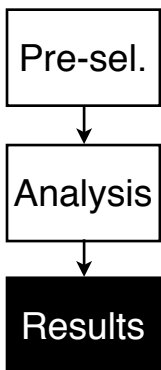

VBF jet modeling is difficult in tiny corner of phase space

- Estimate $N_{ttbar} = N_{MC} \cdot f_{control}$

where
$$f_{control} = \left(\frac{N_{Data}}{N_{MC}} \right)_{control} = 0.6 \pm 0.15$$

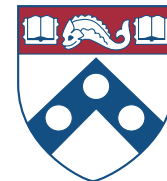

- Repeat with other MCs, find estimates consistent to 15%

ttbar estimate is stable

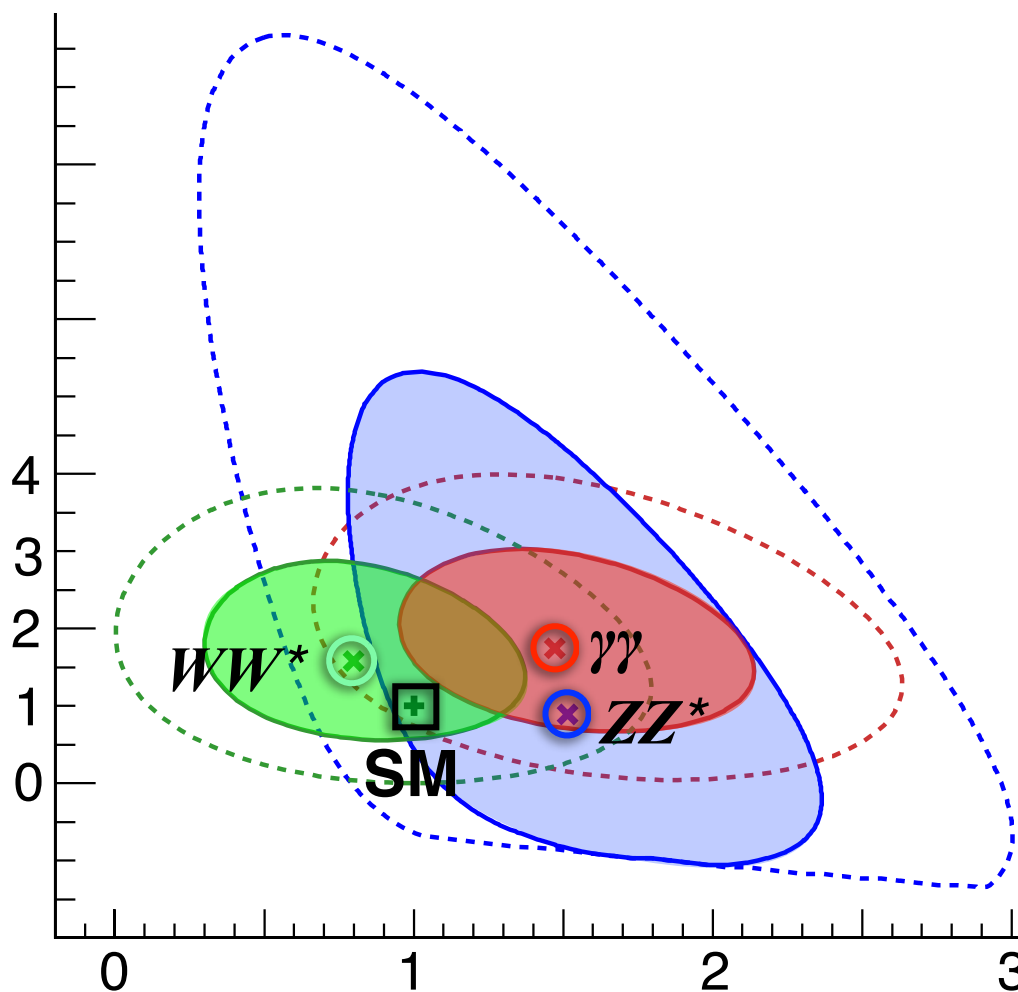

VBF v. ggF with bosons

Hong

- VBF WW^* significance is 2.5σ , 1.6σ
observed expected

$$\frac{(\sigma_{\text{VBF}+\text{VH}} \cdot B)_{\text{Data}}}{(\sigma_{\text{VBF}+\text{VH}} \cdot B)_{\text{SM}}}$$

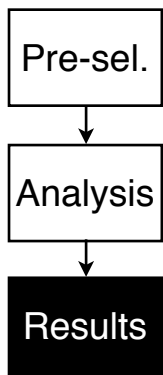

ATLAS [b]

7, 8 TeV data

For 125.5 GeV

- \boxplus Standard Model
- \otimes Best fit individual
- 68% CL
- 95% CL

$$\frac{(\sigma_{\text{ggF}+\text{ttH}} \cdot B)_{\text{Data}}}{(\sigma_{\text{ggF}+\text{ttH}} \cdot B)_{\text{SM}}}$$

Rescale the axes

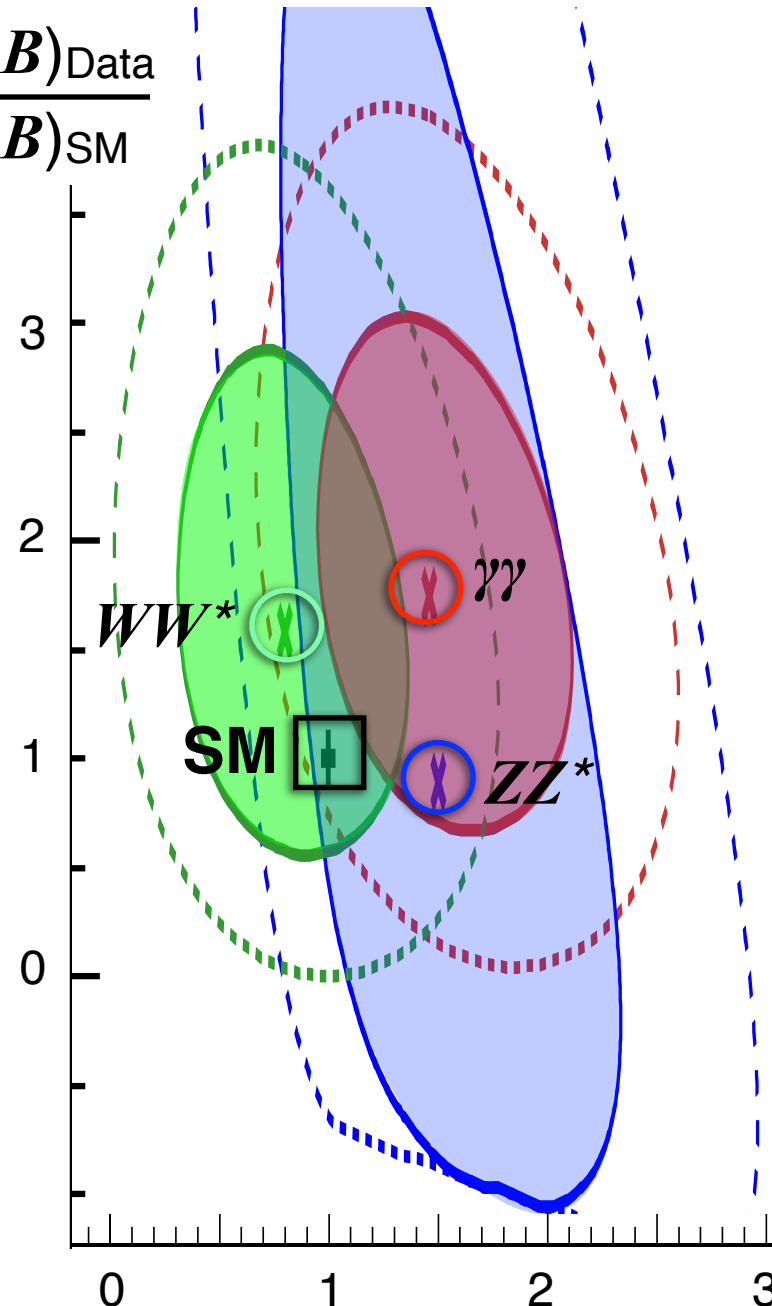

so same metric in x, y

$$\frac{(\sigma_{\text{VBF}+\text{VH}} \cdot B)_{\text{Data}}}{(\sigma_{\text{VBF}+\text{VH}} \cdot B)_{\text{SM}}}$$

VBF WW^* measurements

- $\frac{\mu_{\text{VBF}}}{\mu_{\text{ggF}}} = 2.0 \pm \begin{smallmatrix} 2.2 \\ 1.0 \end{smallmatrix}$
- $\mu_{\text{VBF}} = 1.6 \pm 0.8$
40% stat.
25% syst.

For all modes, ggF rates better than VBF by $\sim 2x$

ATLAS [b]
7, 8 TeV data
For 125.5 GeV

- ⊕ Standard Model
- ⊗ Best fit individual
- 68% CL
- 95% CL
- Axes rescaled from the original

$$\frac{(\sigma_{\text{ggF}+\text{ttH}} \cdot B)_{\text{Data}}}{(\sigma_{\text{ggF}+\text{ttH}} \cdot B)_{\text{SM}}}$$

Evidence of VBF

in boson final states

Combine $WW^*, ZZ^*, \gamma\gamma$

- VBF evidence at 3.3σ
- $\frac{\mu_{\text{VBF+VH}}}{\mu_{\text{ggF+ttH}}} = 1.4 \pm_{0.3}^{0.4} \pm_{0.4}^{0.6}$
(stat) (syst)
- $= 1.4 \pm_{0.5}^{0.7}$

Measured ggF, VBF with bosons

What about fermions?

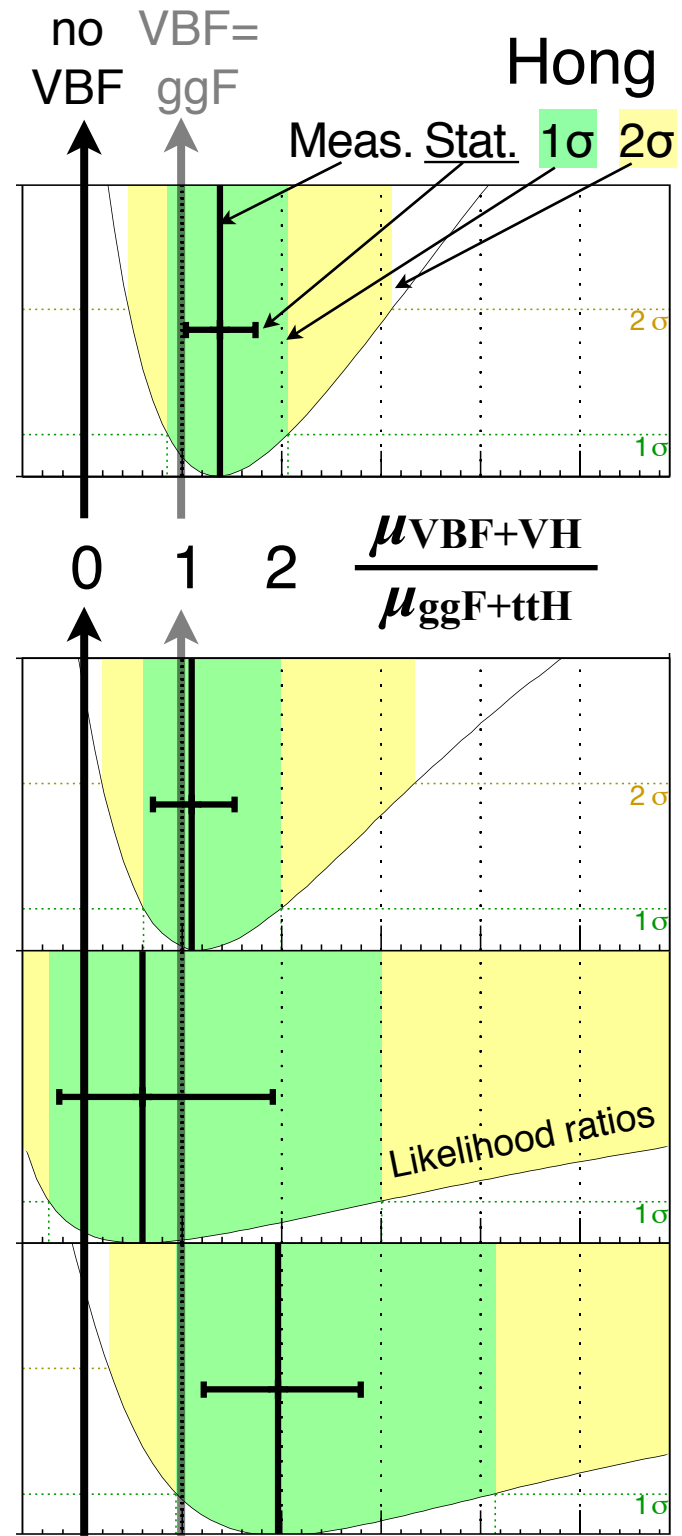

ATLAS [b]
For 125.5 GeV
7, 8 TeV data

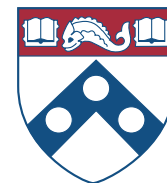

Combined

$H \rightarrow \gamma\gamma$

$H \rightarrow ZZ^*$

$H \rightarrow WW^*$

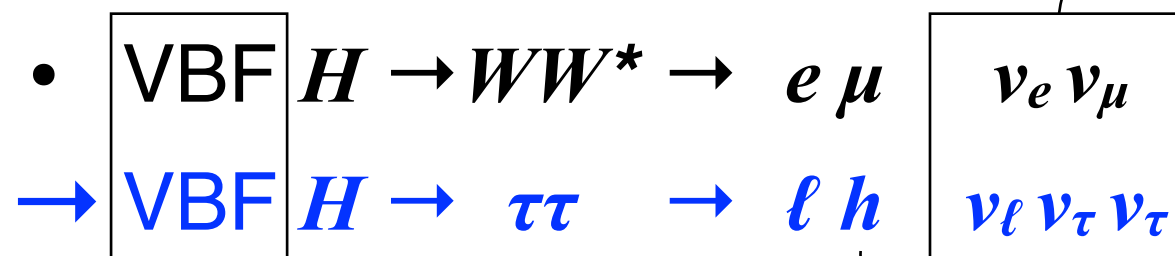

Introduction

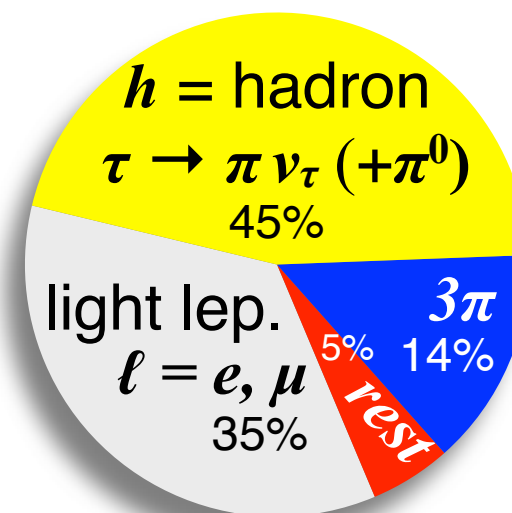

- Higgs via VBF
- ATLAS at LHC

Focus on similar final states

Missing E_T (MET)

Putting it together

VBF $\tau\tau \rightarrow \ell h$

Analysis flowchart

Hong

- Trigger on ℓ

Pre-sel.

- Require non- b jets with $\Delta\eta_{jj} > 3$
- Require ℓ , $\tau \rightarrow h$, MET

Already
discussed

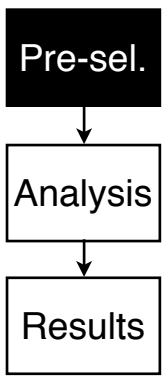

Analysis

- Define variables for VBF production
- Define variables for $H \rightarrow \tau\tau$ decay
- Train BDT to select H using all vars
- Background model validation

This
section

Results

- Fit BDT score to get μ_{Higgs}

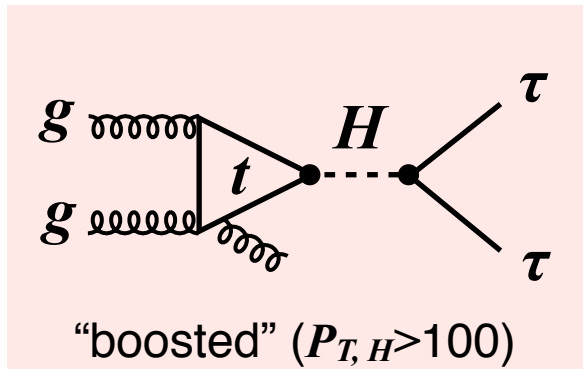

$\tau\tau$ physics with N_{Jet}

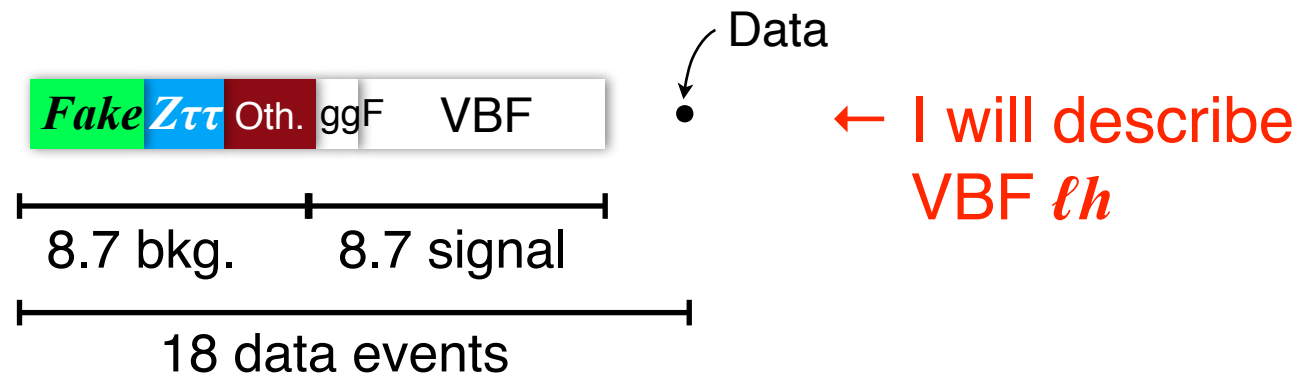

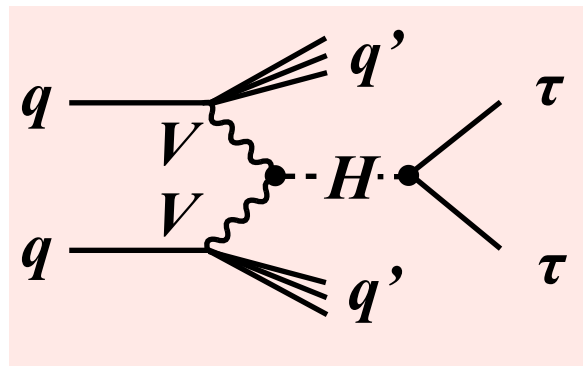

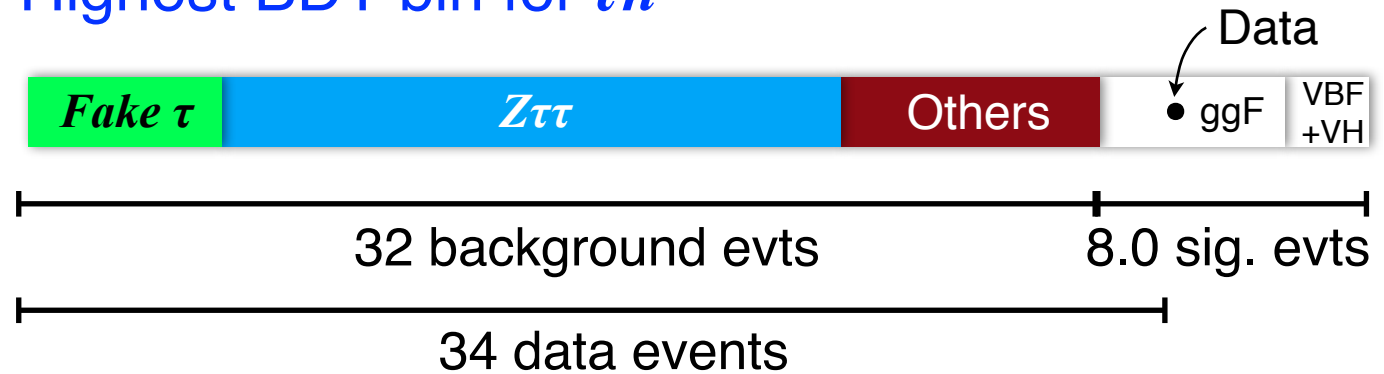

- Like WW^* : have ggF, VBF

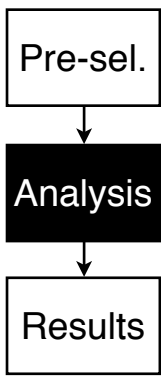

yes	better S/B	WW^*
good	best	$\tau\tau$

$$\text{Rate} \propto |g_F|^2$$

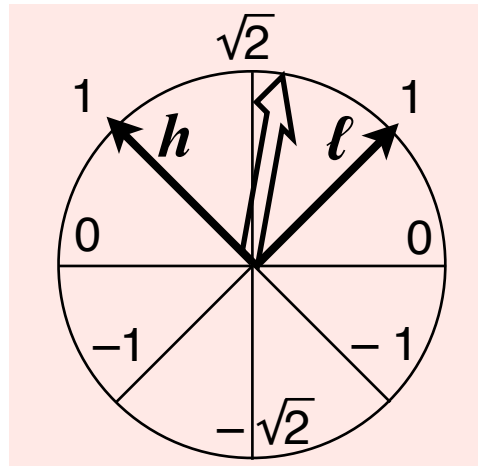

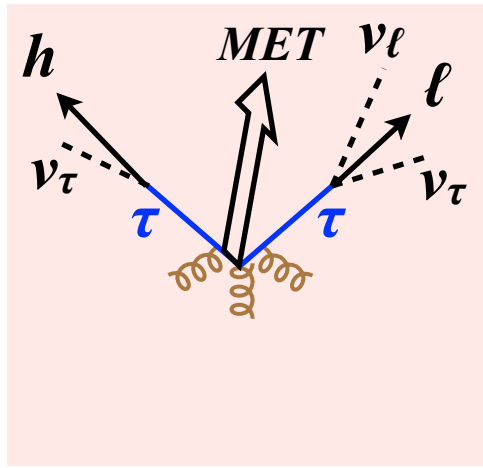

Highest BDT bin for ℓh

Suppress fake $\tau\tau$ with ϕ_{MET}

- Neutrinos from τ decays are mostly collinear
- Define “centrality” of ϕ_{MET} w.r.t. charged daughters

ν along ℓ , so \overrightarrow{MET}
in between

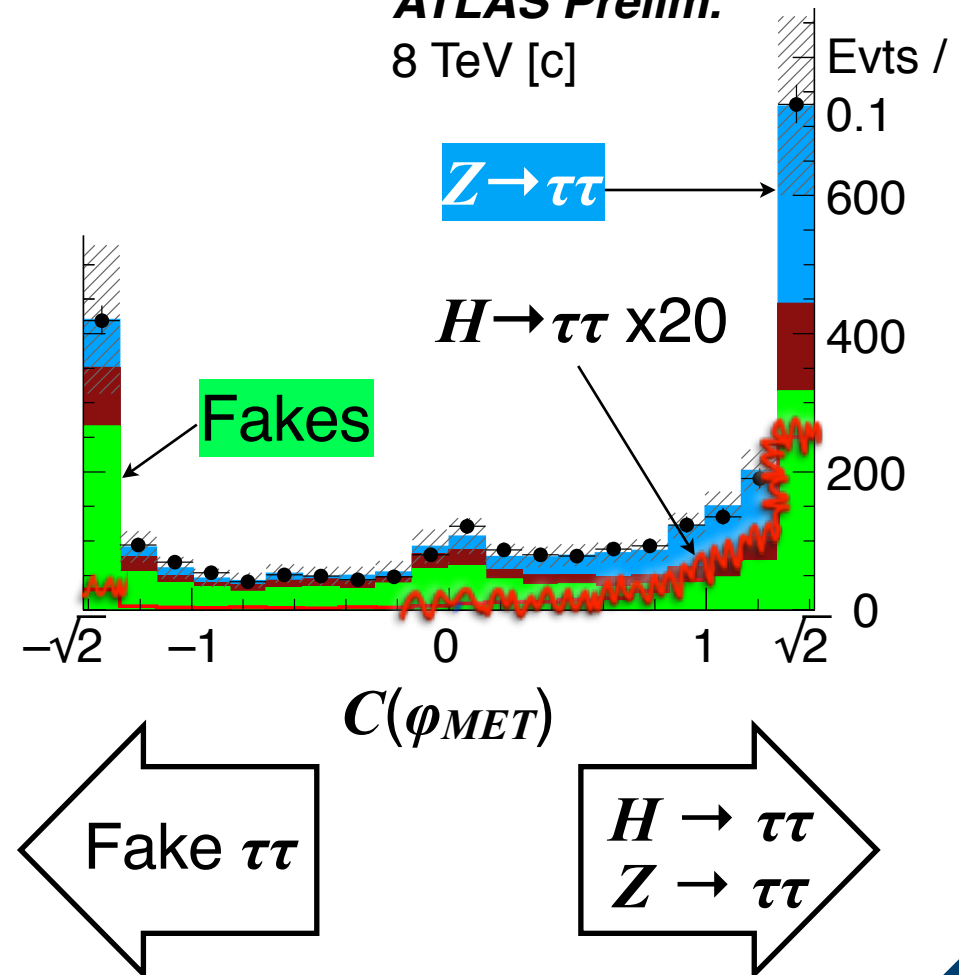

Construct a
metric w.r.t. ℓ , h

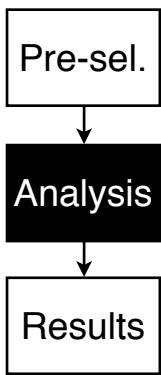

Good separation from fake $\tau\tau$

$H \rightarrow \tau\tau \rightarrow \ell h, \geq 2j$

ATLAS Prelim.

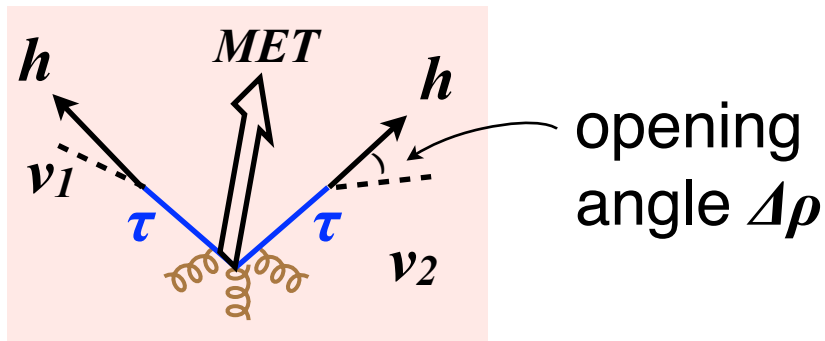

8 TeV [c]

Suppress $Z \rightarrow \tau\tau$ with $M(\tau\tau)$

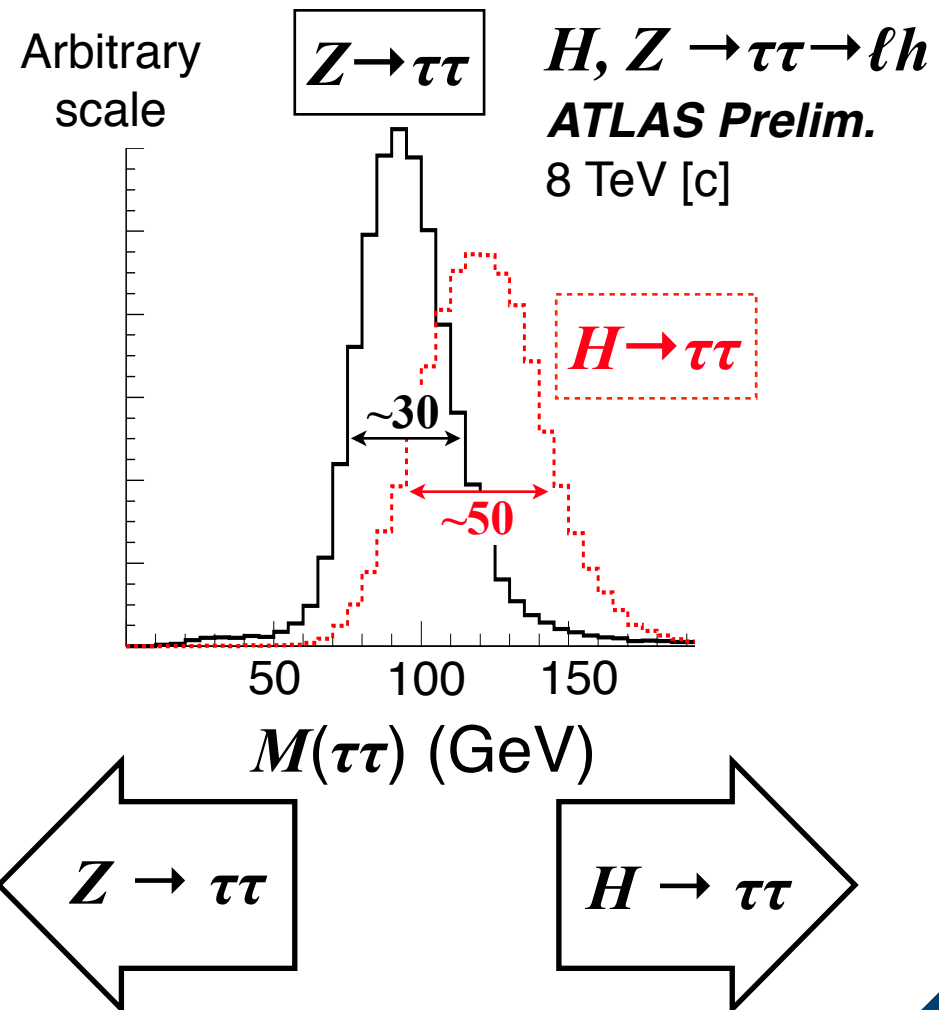

- $M(\tau\tau) = M(\ell h \nu_e \nu_\tau \nu_\tau)$, so need $\vec{P}_{\nu 1}, \vec{P}_{\nu 2}, \vec{P}_{\nu 3}$
- $MET_{x,y} = (\sum_i \vec{P}_{\nu, i})_{x,y}$ resolution smears constraint
- Parametrize unknowns by opening angles $\Delta\rho$

A. Elagin *et al.*, NIM A654 (2011) 481

1. Generate $\Delta\rho$ distributions with MC
2. Scan allowed configurations, pick most likely $M(\tau\tau)$ for each event

Good separation from $Z \rightarrow \tau\tau$

VBF $H \rightarrow \tau\tau \rightarrow eh MET$

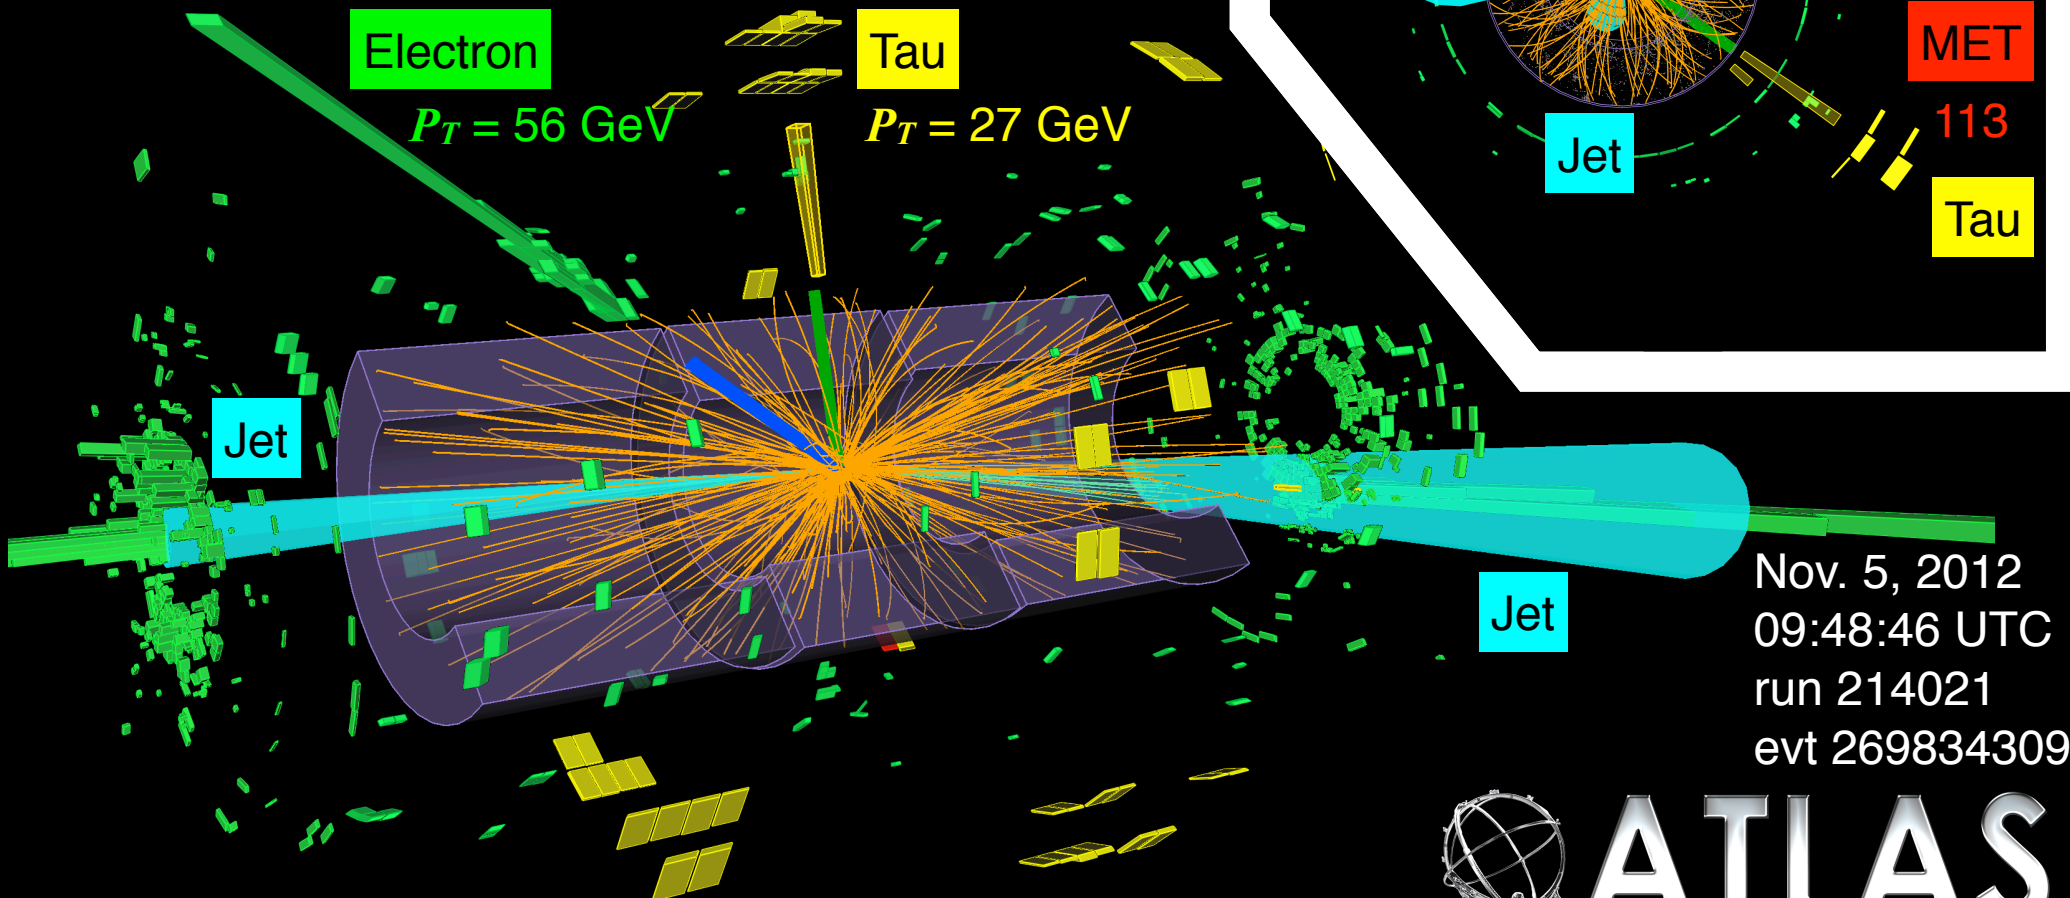

Hong

VBF - $M_{jj} = 1.5 \text{ TeV}$

$H\tau\tau$ - $M_{\tau\tau} = 129 \text{ GeV}$

BDT score = 0.99, S/B here is 1.0

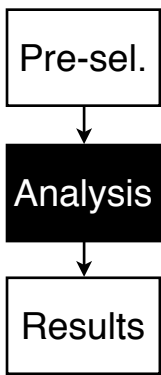

Nov. 5, 2012
09:48:46 UTC
run 214021
evt 269834309

VBF-like in jj & Higgs-like in decay

ATLAS
EXPERIMENT

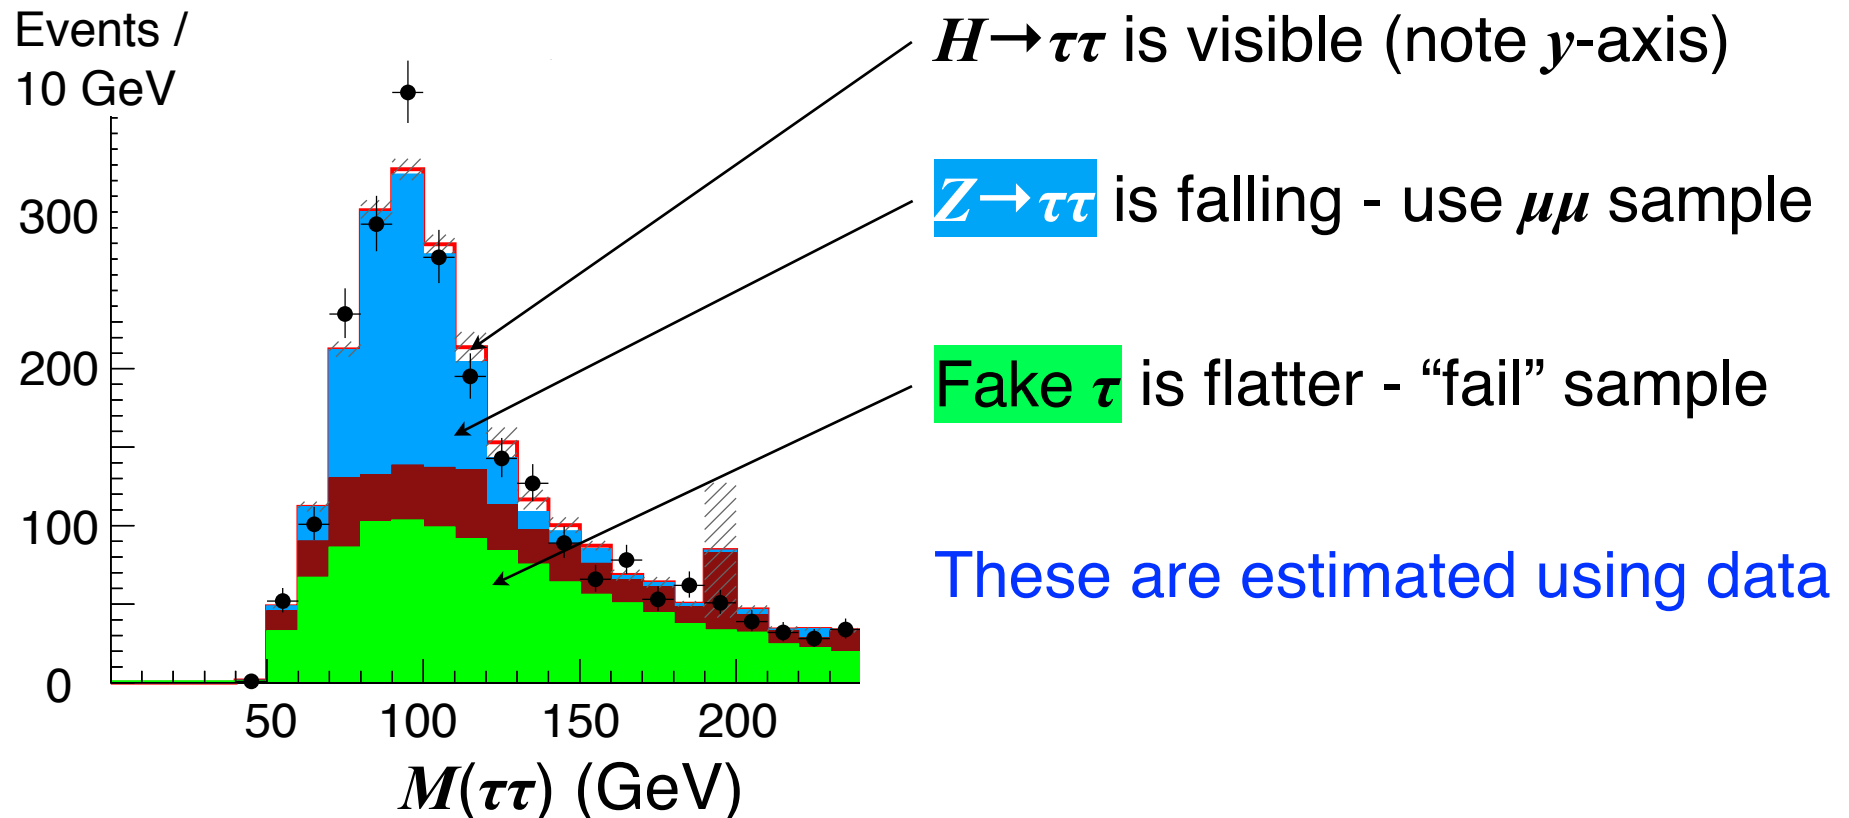

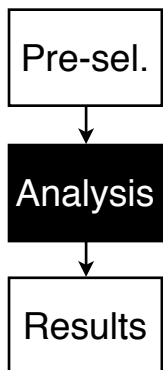

Train BDT to select Higgs

- Feed BDT the variables for VBF production, H decay
- I described the key ones already
- Let's look at $M(\tau\tau)$ before applying BDT

$$H \rightarrow \tau\tau \rightarrow \ell h, \geq 2j$$

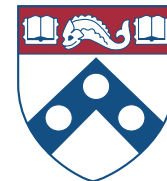

ATLAS Prelim., 8 TeV [c]

Method, validation of $Z \rightarrow \tau\tau$

Hong

- Fact: $pp \rightarrow Z$ same for $Z \rightarrow \tau\tau$, $Z \rightarrow \mu\mu$
- Select $Z \rightarrow \mu\mu$ with $M_{\mu\mu} > 40$, loosely isolated μ
- Use MC to decay τ in μ 's place

$Z \rightarrow \tau\tau$ control region

$H \rightarrow \tau\tau \rightarrow \ell h, \geq 2j$

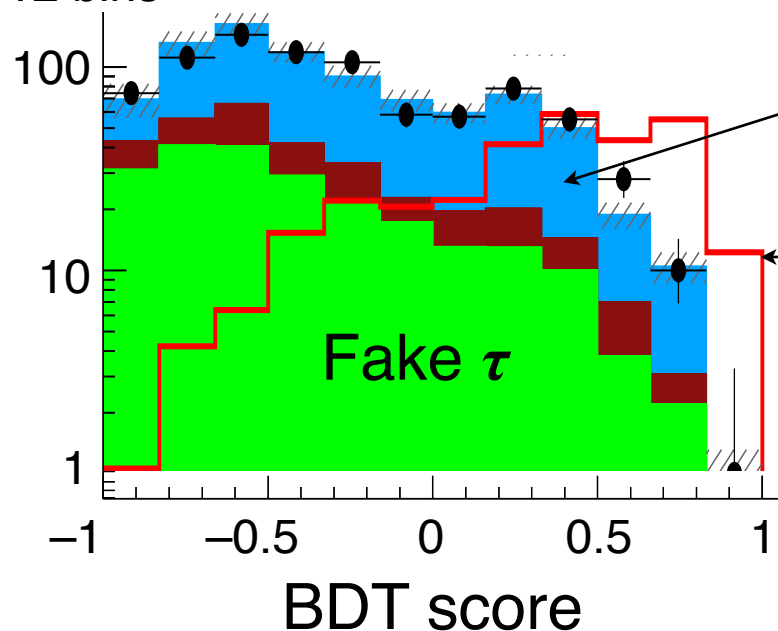

ATLAS Prelim., 8 TeV [c]

Control region definition

$M_{T,W} < 40$ to veto $W \rightarrow \ell\nu$

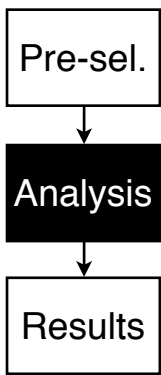

$M(\tau\tau) < 110$ to veto $H \rightarrow \tau\tau$

Events in
12 bins

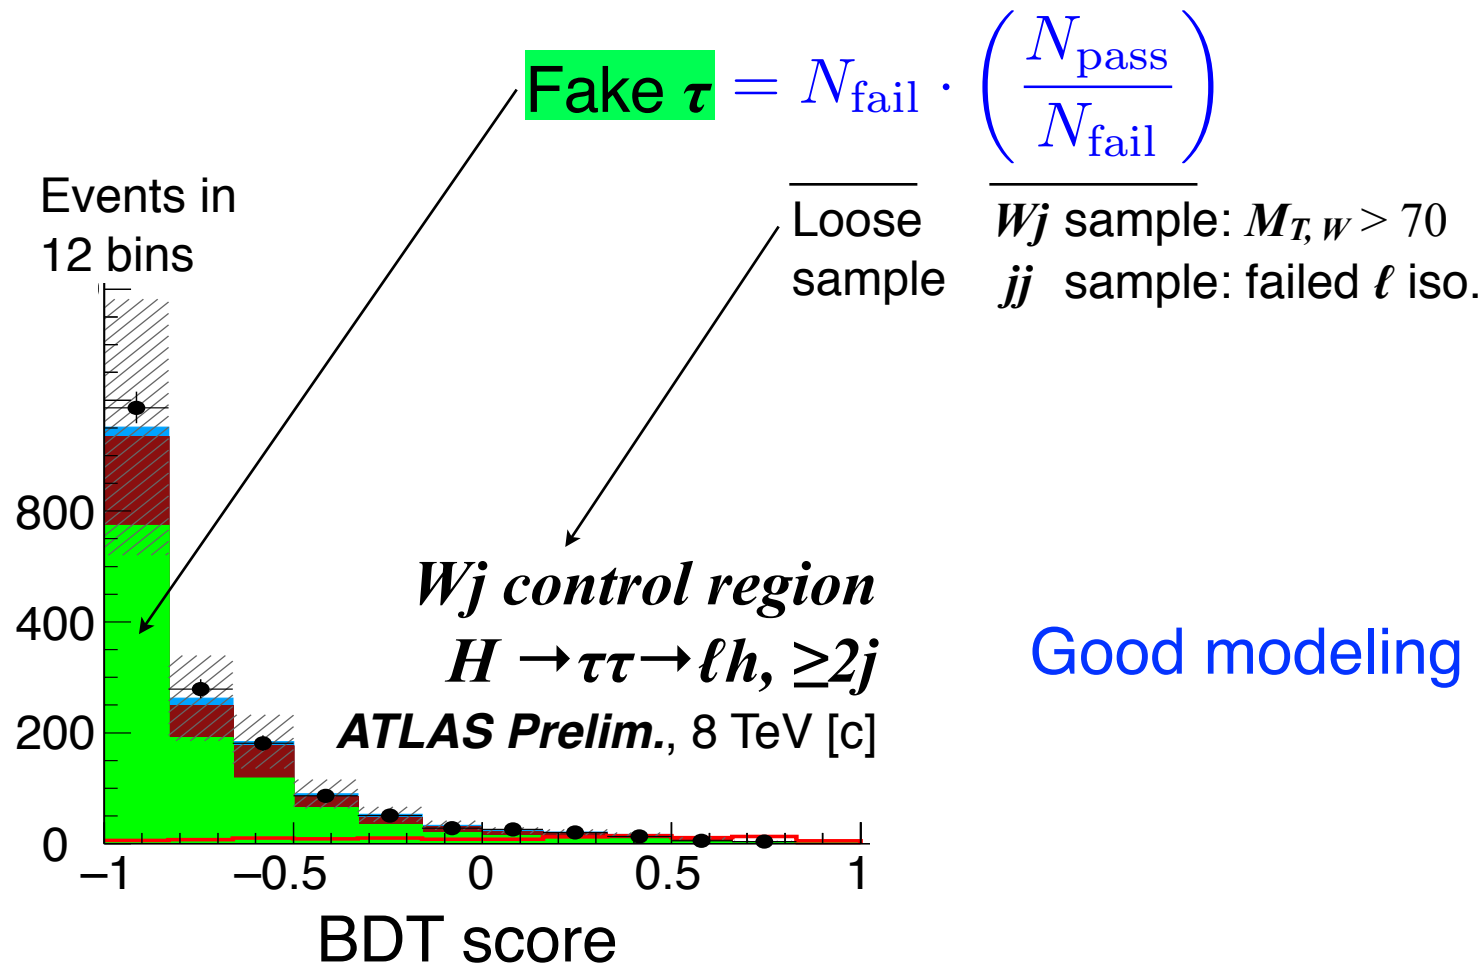

$Z \rightarrow \tau\tau$ good modeling in BDT

$H \rightarrow \tau\tau$ x50

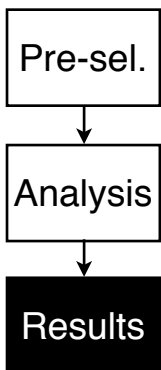

Method, validation of jet faking τ

- $W \text{ jet} \rightarrow \ell h_{\text{fake}}$ fakes $H \rightarrow \tau\tau \rightarrow \ell h$
- N_{fail} are signal-like events with h failing strict id.
- Get fail-to-pass ratio using a pure jet sample

Good modeling in BDT

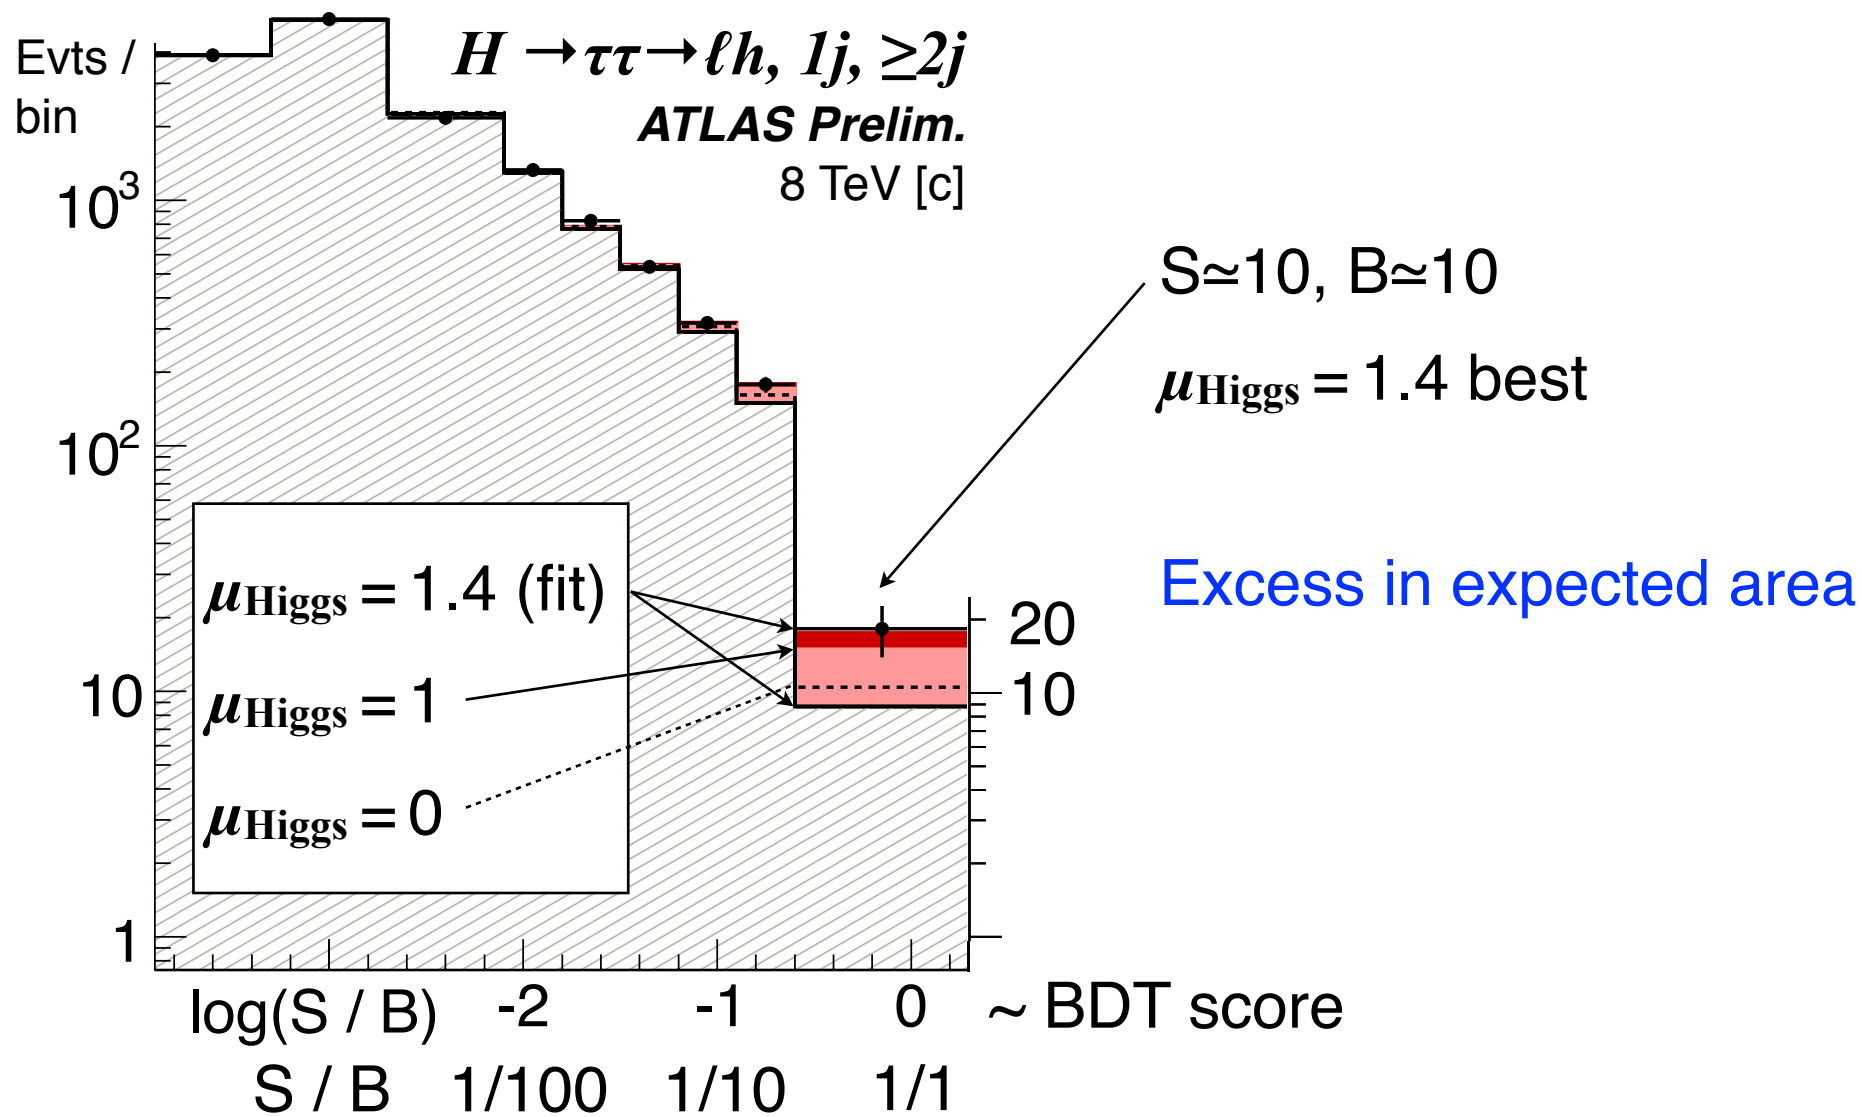

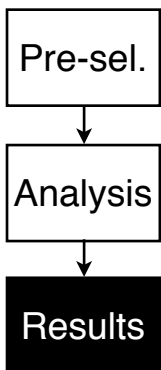

BDT applied to data

Hong

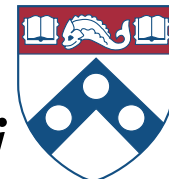

- Look at classification for ℓh in for $1j, \geq 2j$

Combined result v. 125

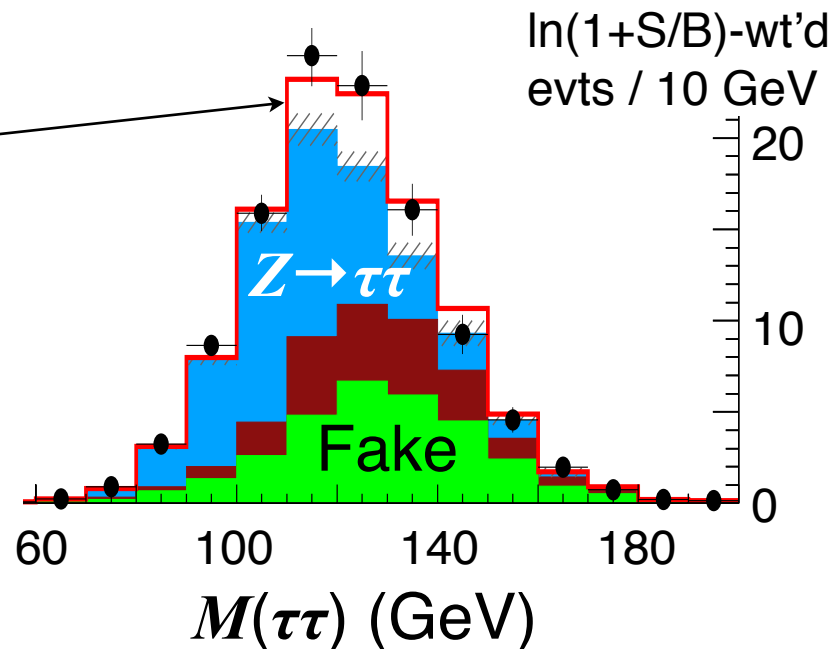

$H \rightarrow \tau\tau \rightarrow \ell h, \geq 2j$
 ATLAS Prelim., 8 TeV [c]

- S/B weighted $M(\tau\tau)$ for $1j, \geq 2j$

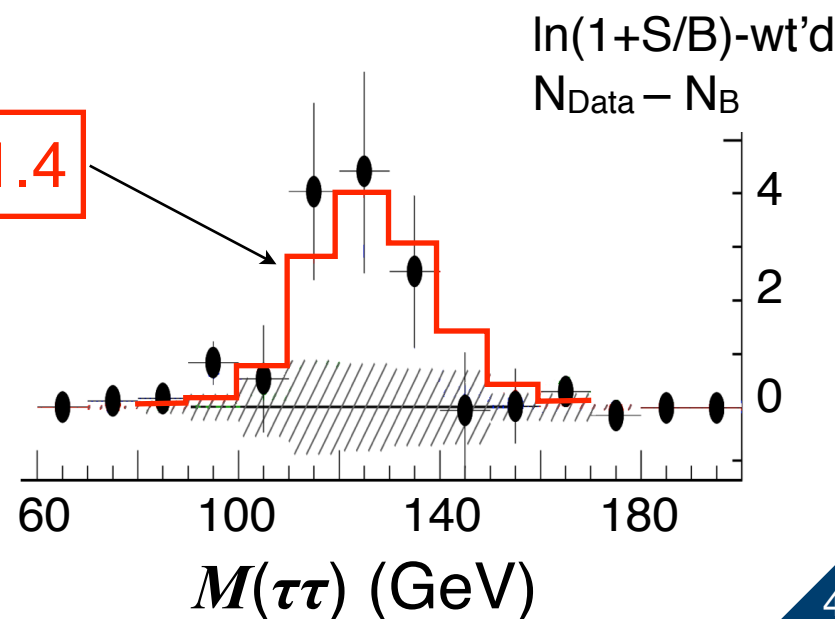

$H \rightarrow \tau\tau$
 $(\mu=1.4)$

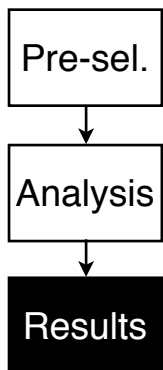

- Significance (with $\ell\ell, hh$)
 is 4.1σ , 3.2σ
 observed expected

- Excess at expected
 for Higgs at 125

$\mu_{H125} = 1.4$

Combined result v. 125

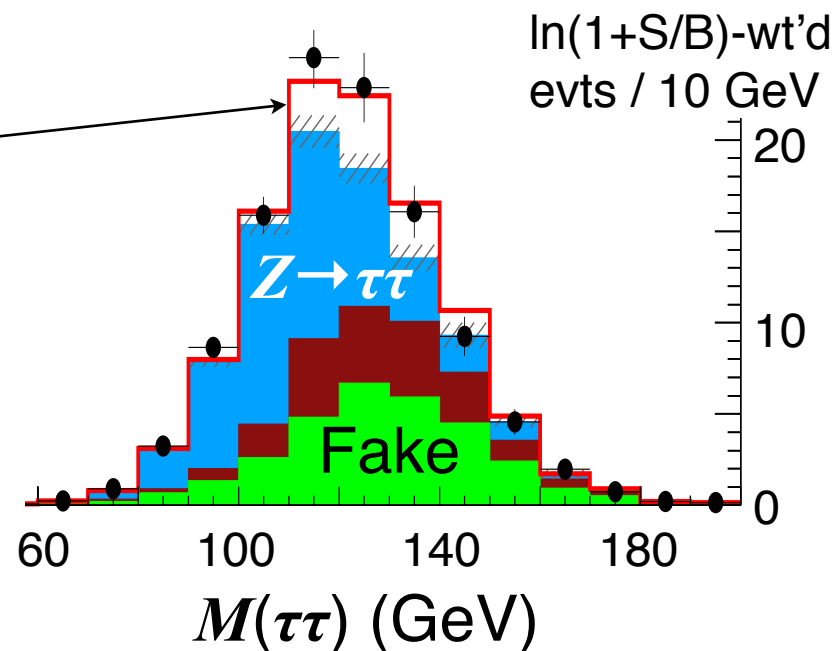

$H \rightarrow \tau\tau \rightarrow \ell h, \geq 2j$
 ATLAS Prelim., 8 TeV [c]

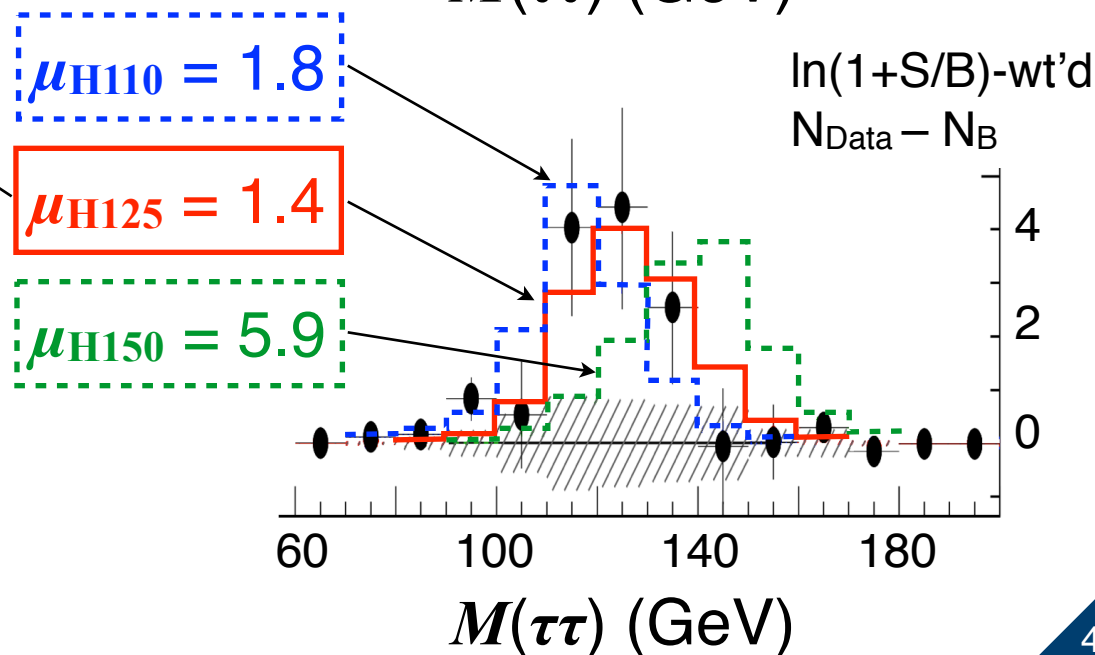

- S/B weighted $M(\tau\tau)$ for $1j, \geq 2j$

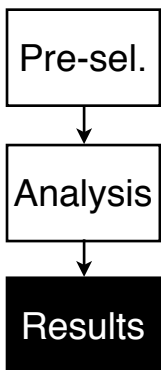

$H \rightarrow \tau\tau$
 $(\mu=1.4)$

- Significance (with $\ell\ell, hh$)
 is 4.1σ , 3.2σ
 observed expected

- Excess at expected
 for Higgs at 125

VBF v. ggF with $H \rightarrow \tau\tau$

Hong

- $\mu_{\text{Higgs}} = 1.6 \pm 0.6$ in ≥ 2 jets (mostly VBF)

30% stat.

30% syst.

$$\frac{(\sigma_{\text{VBF}+\text{VH}} \cdot B)_{\text{Data}}}{(\sigma_{\text{VBF}+\text{VH}} \cdot B)_{\text{SM}}}$$

⊗ Best fit individual

— 68% CL

-- 95% CL

Axes rescaled
from the original

Observations

- $\tau\tau$ different shape because VBF-driven
- $\tau\tau \sim WW^* \sim \gamma\gamma$ in VBF
- All consistent with SM within errors

Introduction

- Higgs via VBF
- ATLAS at LHC

Focus on similar final states

- VBF $H \rightarrow WW^*$ \rightarrow $e \mu$ $\nu_e \nu_\mu$
- VBF $H \rightarrow \tau\tau$ \rightarrow ℓh $\nu_\ell \nu_\tau \nu_\tau$

Missing E_T (MET)

→ Putting it together

2 lepton-like objects

Putting it together into g

Hong

Are Higgs couplings modified?

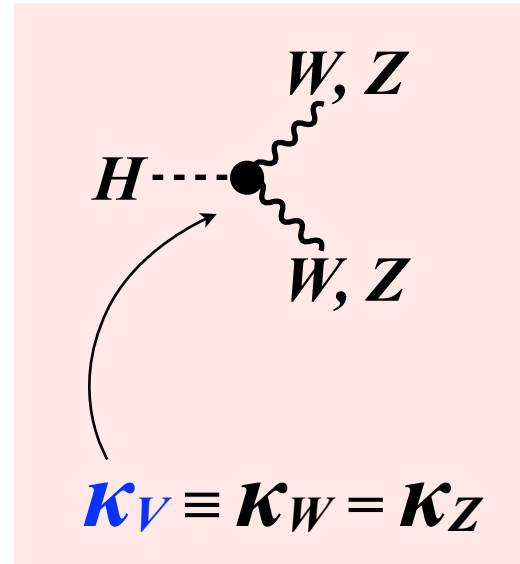

- Consider ratio w.r.t. SM

$$\kappa_X \equiv \frac{g_{X, \text{Data}}}{g_{X, \text{SM}}} = 1 \text{ for SM value}$$

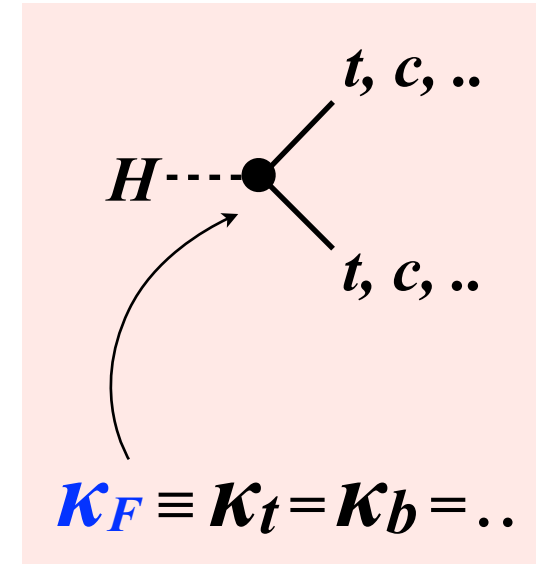

for any particle “X”

If we had large statistics,
determine κ for each vertex

- But we don't (yet)
- Usually “lump” some together to taste, e.g., $\kappa_V \equiv \kappa_W = \kappa_Z$

Vector bosons

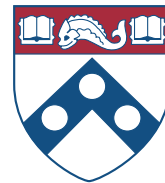

Fermions

$$\left| \begin{array}{c} q \text{---} V \text{---} q' \\ q \text{---} V \text{---} q' \end{array} \right. \text{---} H \text{---} \left. \begin{array}{c} W \\ W \end{array} \right| ^2 \propto (\kappa_V)^4$$

Example

Higgs in EW same as in fermion?

Hong

Benchmark scenario:

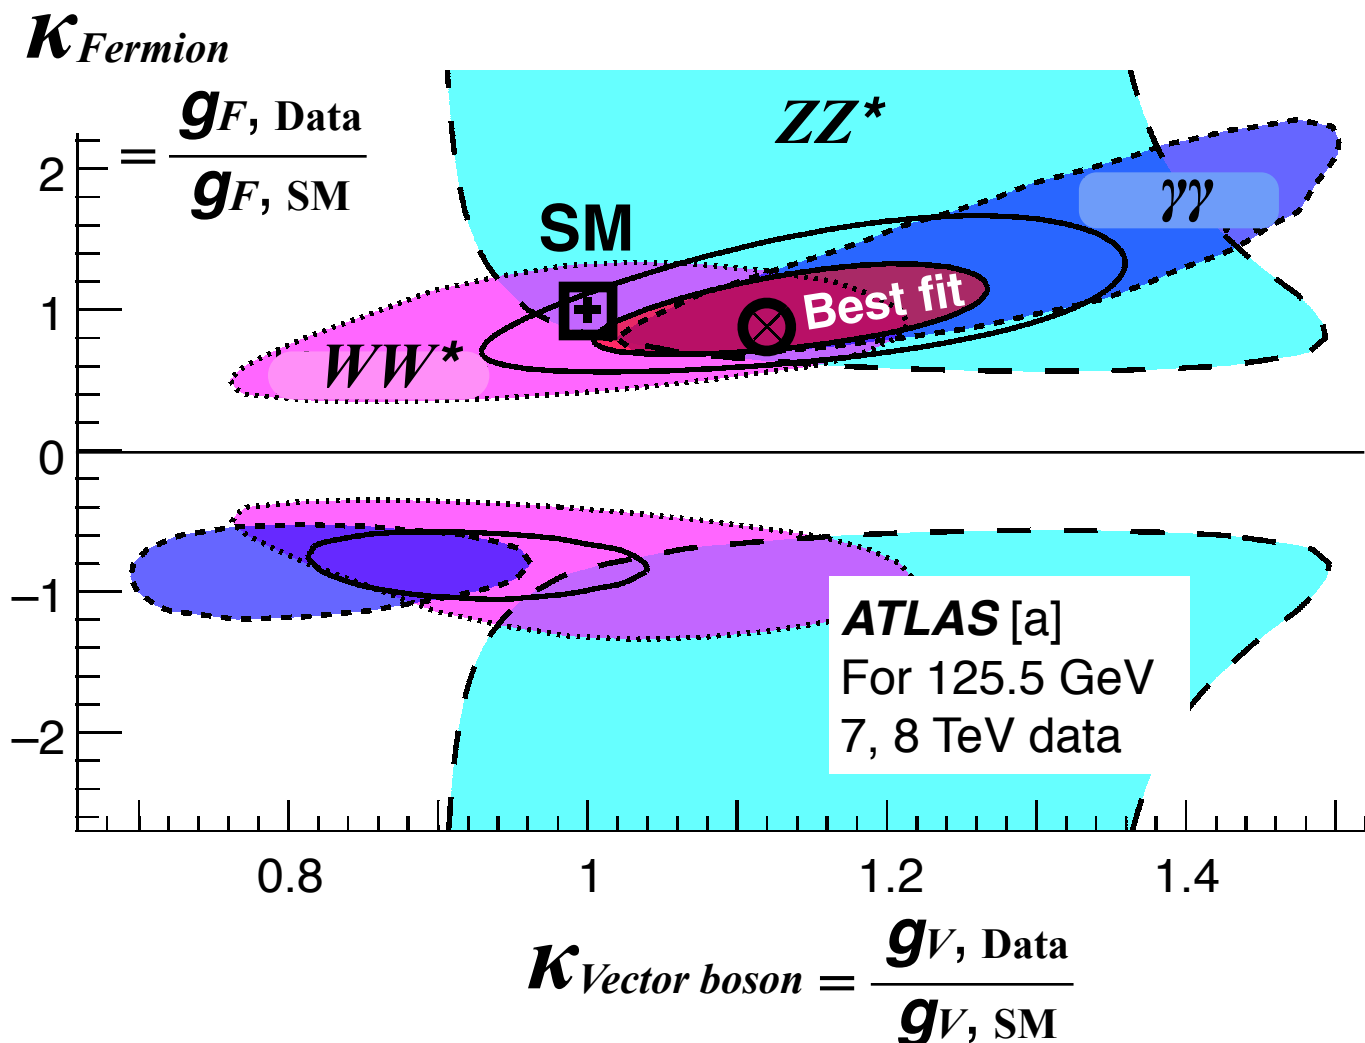

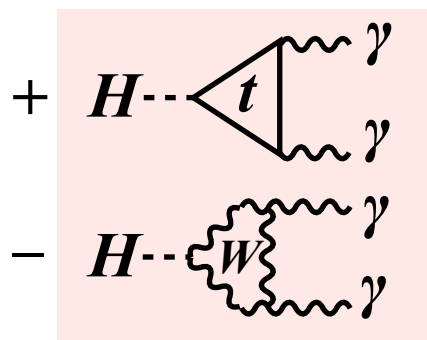

- Vector boson couplings deviate from SM by common factor κ_{Vector}
- Fermions deviate from SM by common factor $\kappa_{Fermion}$

Results

- Consistent with SM, but large errors

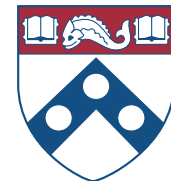

Features

- All rates $\propto \kappa^2$, except for $\gamma\gamma$

Rescale the axes

and omit negative solution

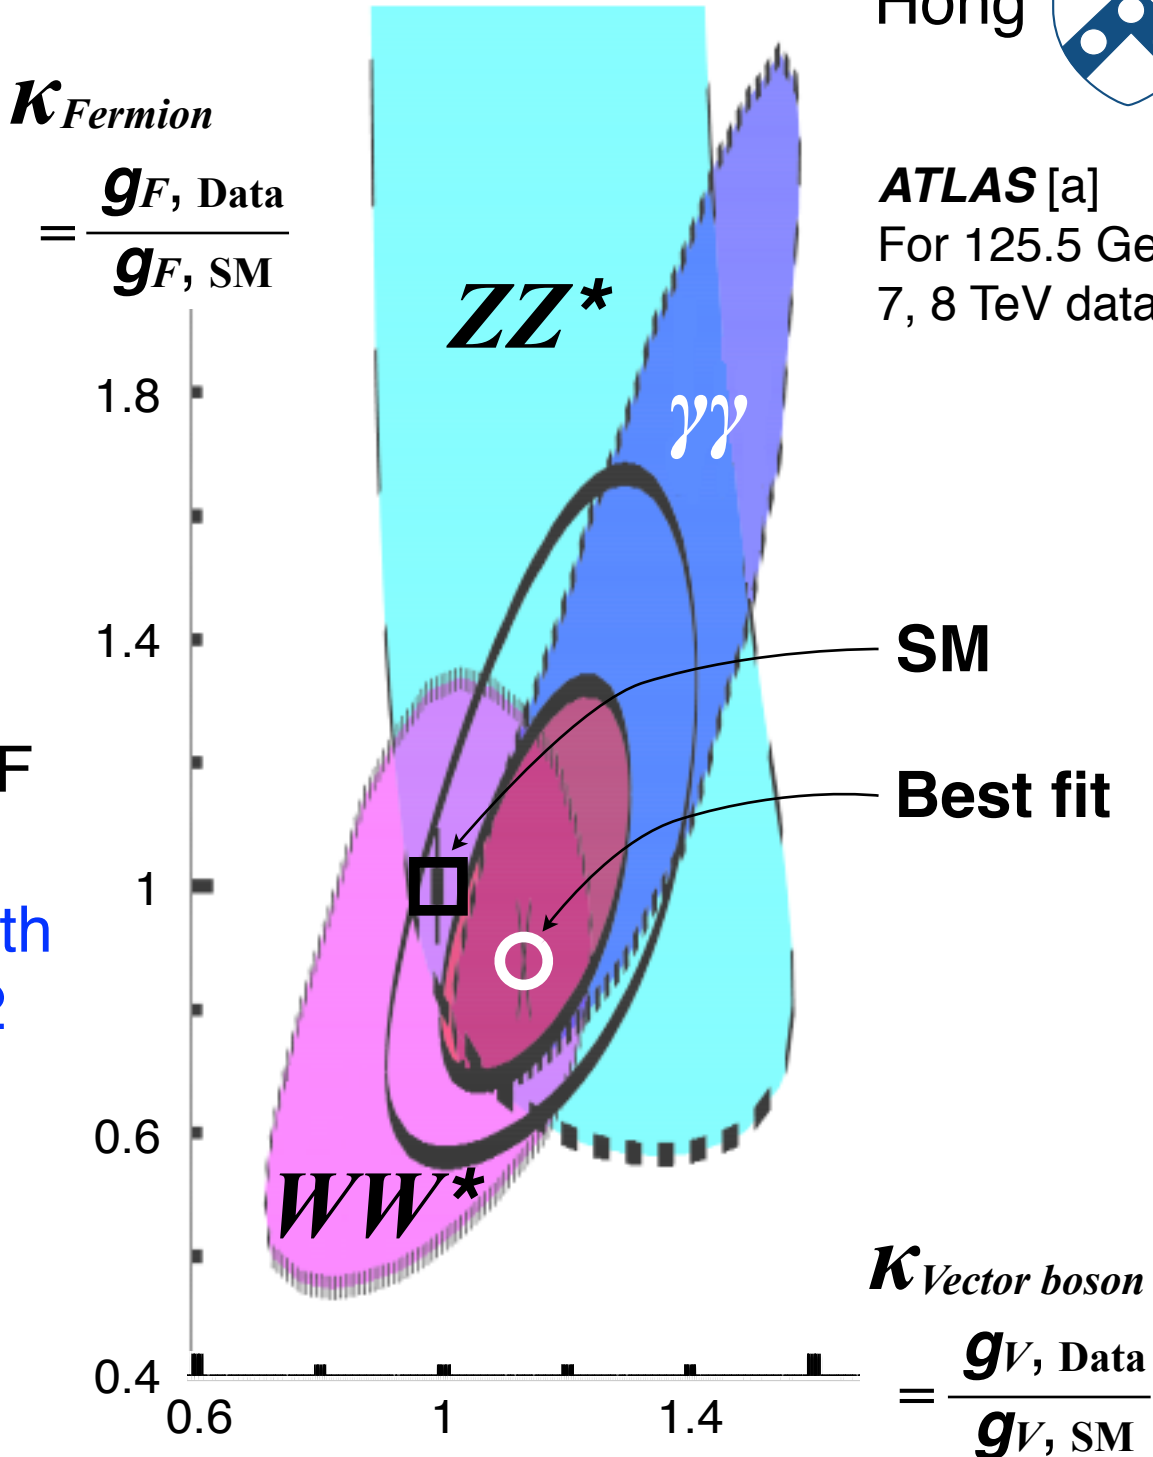

Hong

ATLAS [a]
For 125.5 GeV
7, 8 TeV data

Observations

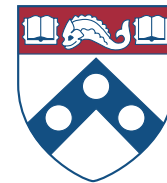

- All far from (0, 0)
- See κ_V 2x better than κ_F ,
ggF rate 2x better than VBF

VBF is statistics limited, so both
axes will get better with Run-2

What if rates remain high?

Hong

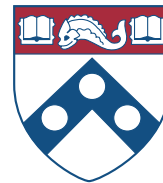

Higgs width or something else? Take WW^* as example.

Rate depends on width: WW^* rate = $(\sigma \cdot B)_{WW} \equiv \sigma \cdot \frac{\Gamma_{WW}}{\Gamma_{\text{total width}}}$

What if rates remain high?

Hong

Higgs width or something else? Take WW^* as example.

Rate depends on width: WW^* rate = $(\sigma \cdot B)_{WW} \equiv \sigma \cdot \frac{\Gamma_{WW}}{\Gamma_{\text{total width}}}$

Measure VBF rate:

$$\mu_{W,\text{VBF}} \equiv \frac{(\sigma \cdot B)_{WW,\text{VBF,Data}}}{(\sigma \cdot B)_{WW,\text{VBF,SM}}} = \frac{(\kappa_V)^2 (\kappa_W)^2}{(\kappa_{\text{total}})^2}$$

Measure ggF rate:

$$\mu_{W,\text{ggF}} \equiv \frac{(\sigma \cdot B)_{WW,\text{ggF,Data}}}{(\sigma \cdot B)_{WW,\text{ggF,SM}}} = \frac{(\kappa_g)^2 (\kappa_W)^2}{(\kappa_{\text{total}})^2}$$

What if rates remain high?

Hong

Higgs width or something else? Take WW^* as example.

Rate depends on width: WW^* rate = $(\sigma \cdot B)_{WW} \equiv \sigma \cdot \frac{\Gamma_{WW}}{\Gamma_{\text{total width}}}$

Measure VBF rate:

$$\mu_{W,\text{VBF}} \equiv \frac{(\sigma \cdot B)_{WW,\text{VBF,Data}}}{(\sigma \cdot B)_{WW,\text{VBF,SM}}} = \frac{(\kappa_V)^2 (\kappa_W)^2}{(\kappa_{\text{total}})^2}$$

Measure ggF rate:

$$\mu_{W,\text{ggF}} \equiv \frac{(\sigma \cdot B)_{WW,\text{ggF,Data}}}{(\sigma \cdot B)_{WW,\text{ggF,SM}}} = \frac{(\kappa_g)^2 (\kappa_W)^2}{(\kappa_{\text{total}})^2}$$

Take ratio of rates:

$$R_W = \frac{\mu_{W,\text{VBF}}}{\mu_{W,\text{ggF}}} = \frac{(\kappa_V)^2}{(\kappa_g)^2} \sim \frac{\text{VBF diagram}}{\text{ggF diagram}}$$

• No κ_{total}
• No WW^*

What if rates remain high?

Hong

Higgs width or something else? Take WW^* as example.

Rate depends on width: WW^* rate = $(\sigma \cdot B)_{WW} \equiv \sigma \cdot \frac{\Gamma_{WW}}{\Gamma_{\text{total width}}}$

Measure VBF rate:

$$\mu_{W,\text{VBF}} \equiv \frac{(\sigma \cdot B)_{WW,\text{VBF,Data}}}{(\sigma \cdot B)_{WW,\text{VBF,SM}}} = \frac{(\kappa_V)^2 (\kappa_W)^2}{(\kappa_{\text{total}})^2}$$

Measure ggF rate:

$$\mu_{W,\text{ggF}} \equiv \frac{(\sigma \cdot B)_{WW,\text{ggF,Data}}}{(\sigma \cdot B)_{WW,\text{ggF,SM}}} = \frac{(\kappa_g)^2 (\kappa_W)^2}{(\kappa_{\text{total}})^2}$$

Take ratio of rates:

$$R_W = \frac{\mu_{W,\text{VBF}}}{\mu_{W,\text{ggF}}} = \frac{(\kappa_V)^2}{(\kappa_g)^2} \sim \frac{\text{VBF diagram}}{\text{ggF diagram}}$$

- No κ_{total}
- No WW^*

$R \neq 1$ means κ_V or κ_g not SM.

Conclusions

Hong

Gave details on VBF $H \rightarrow WW^*$, VBF $H \rightarrow \tau\tau$

- Evidence of VBF Higgs
- Evidence of Higgs-lepton coupling

LHC as a vector boson collider

- VBF is statistically limited, so Run-2 data crucial
- VBF is important tool to study Higgs sector

Great potential for sensitivity to new physics!

Thanks

Muons, electrons

Hong

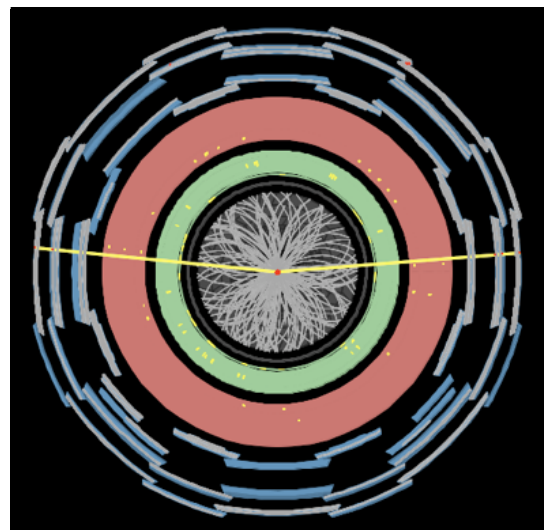

$$H \rightarrow ZZ^* \rightarrow \mu\mu\mu\mu$$

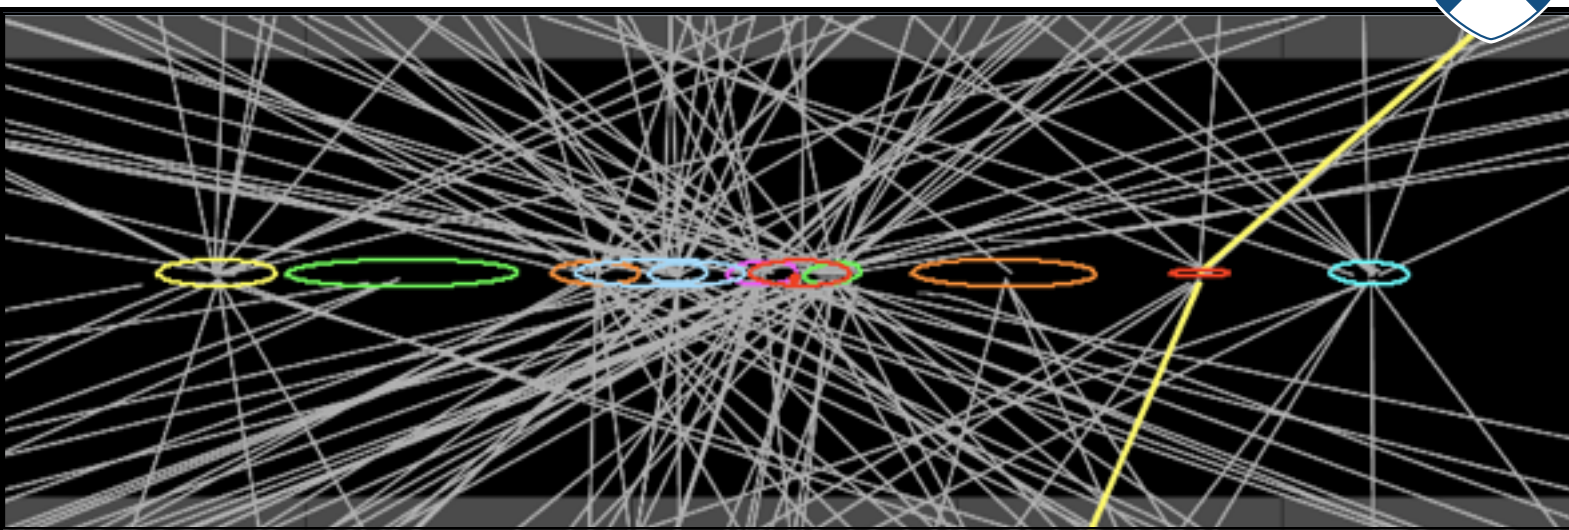

$$H \rightarrow \gamma\gamma \rightarrow \gamma ee$$

High luminosity \rightarrow high pile-up $\langle \mu \rangle$

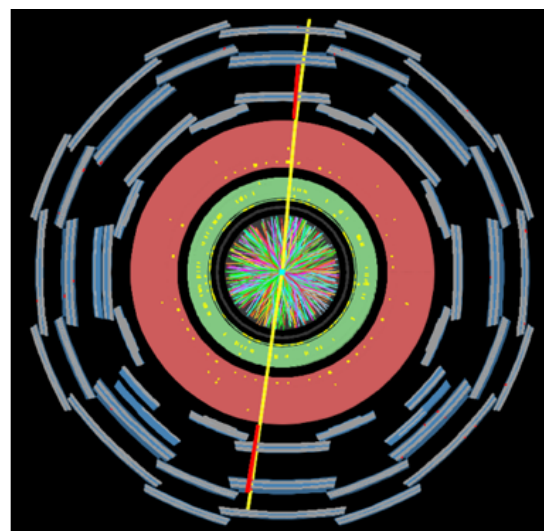

Hong

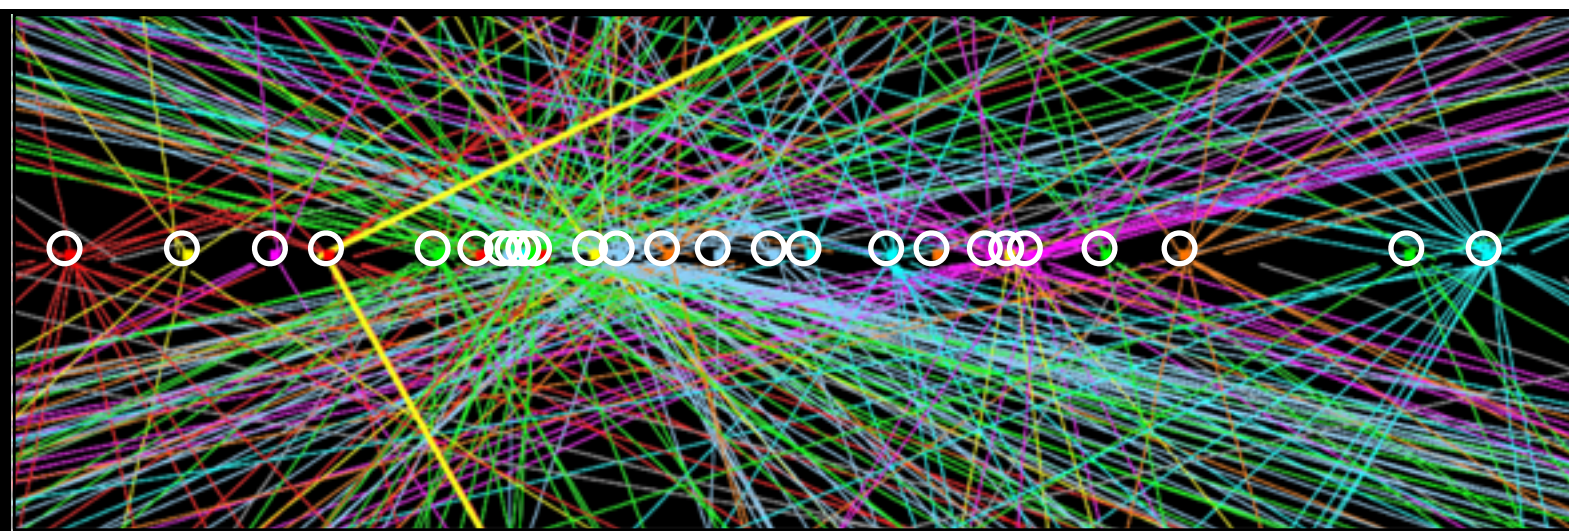

2011, 11 vertices

Between vertices $\langle \Delta z \rangle \approx 2 - 3 \text{ mm}$, $\sigma_{\Delta z} \approx 0.2 \text{ mm}$

2012, 25 vertices

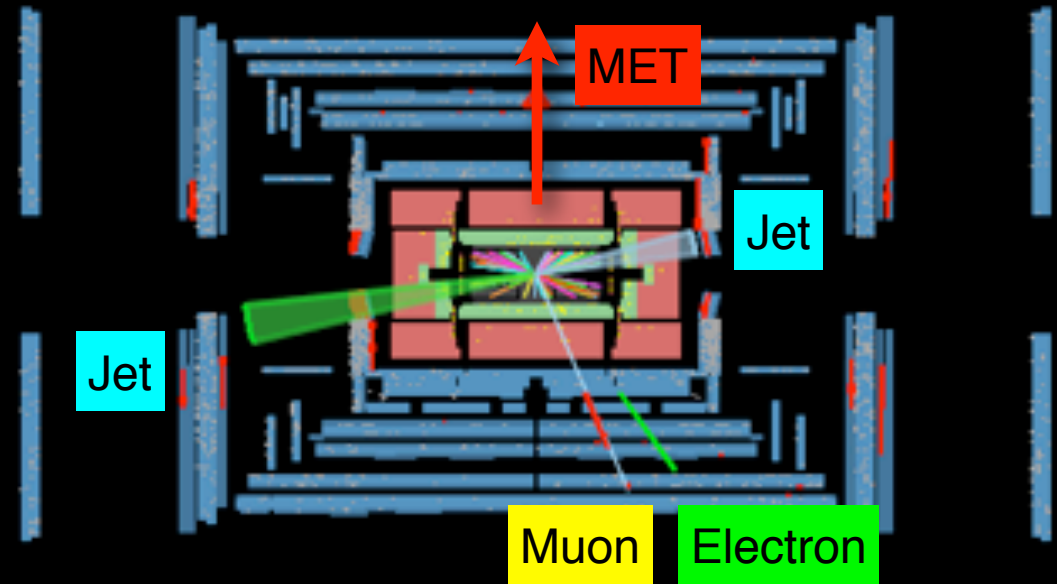

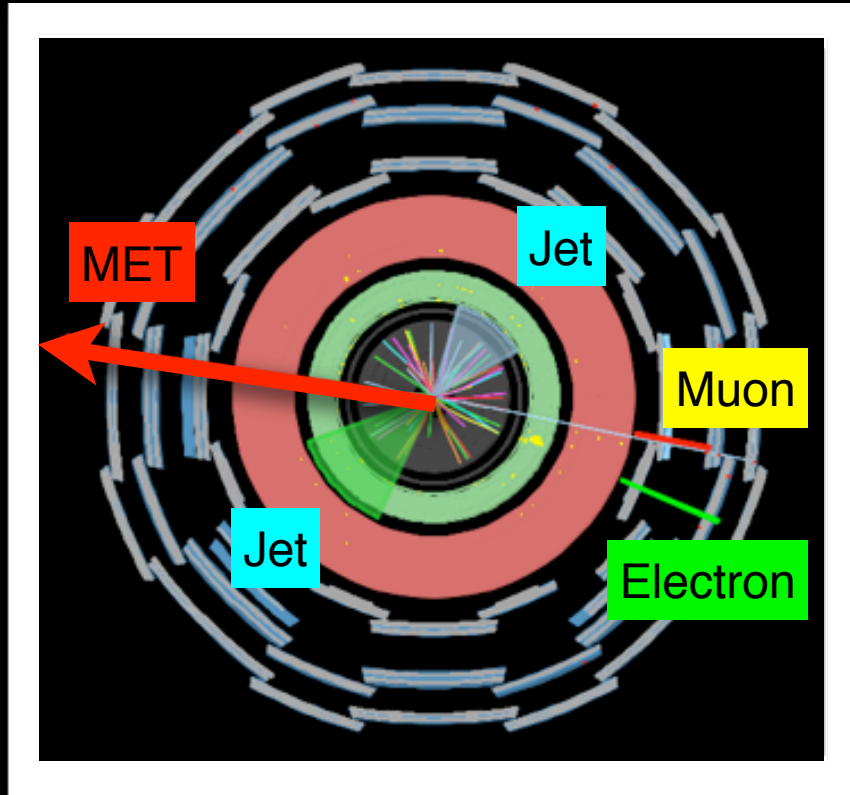

Interaction region width in $z \approx 5 - 6 \text{ cm}$

Pile-up increased from 2011 to 2012

VBF, $H jj \rightarrow WW^* jj \rightarrow e\mu jj MET$

Jun. 17, 2012
07:18:33 CEST
run 205071
evt 160243894

VBF ($\Delta\eta_{jj} = 4.7$
 $M_{jj} = 531$
 $M_{e\mu} = 21 \text{ GeV}$
HWW ($\Delta\phi_{\ell\ell} = 0.23$
 $M_T = 134$

Event characteristics

- Jets are forward with $\eta \sim \pm 2.4$
- Large $t\bar{t} \rightarrow WbWb \rightarrow e\mu bb MET$
- Veto with b -tag operating pt. 85%

Another event that is VBF-like in jj & Higgs-like in decay

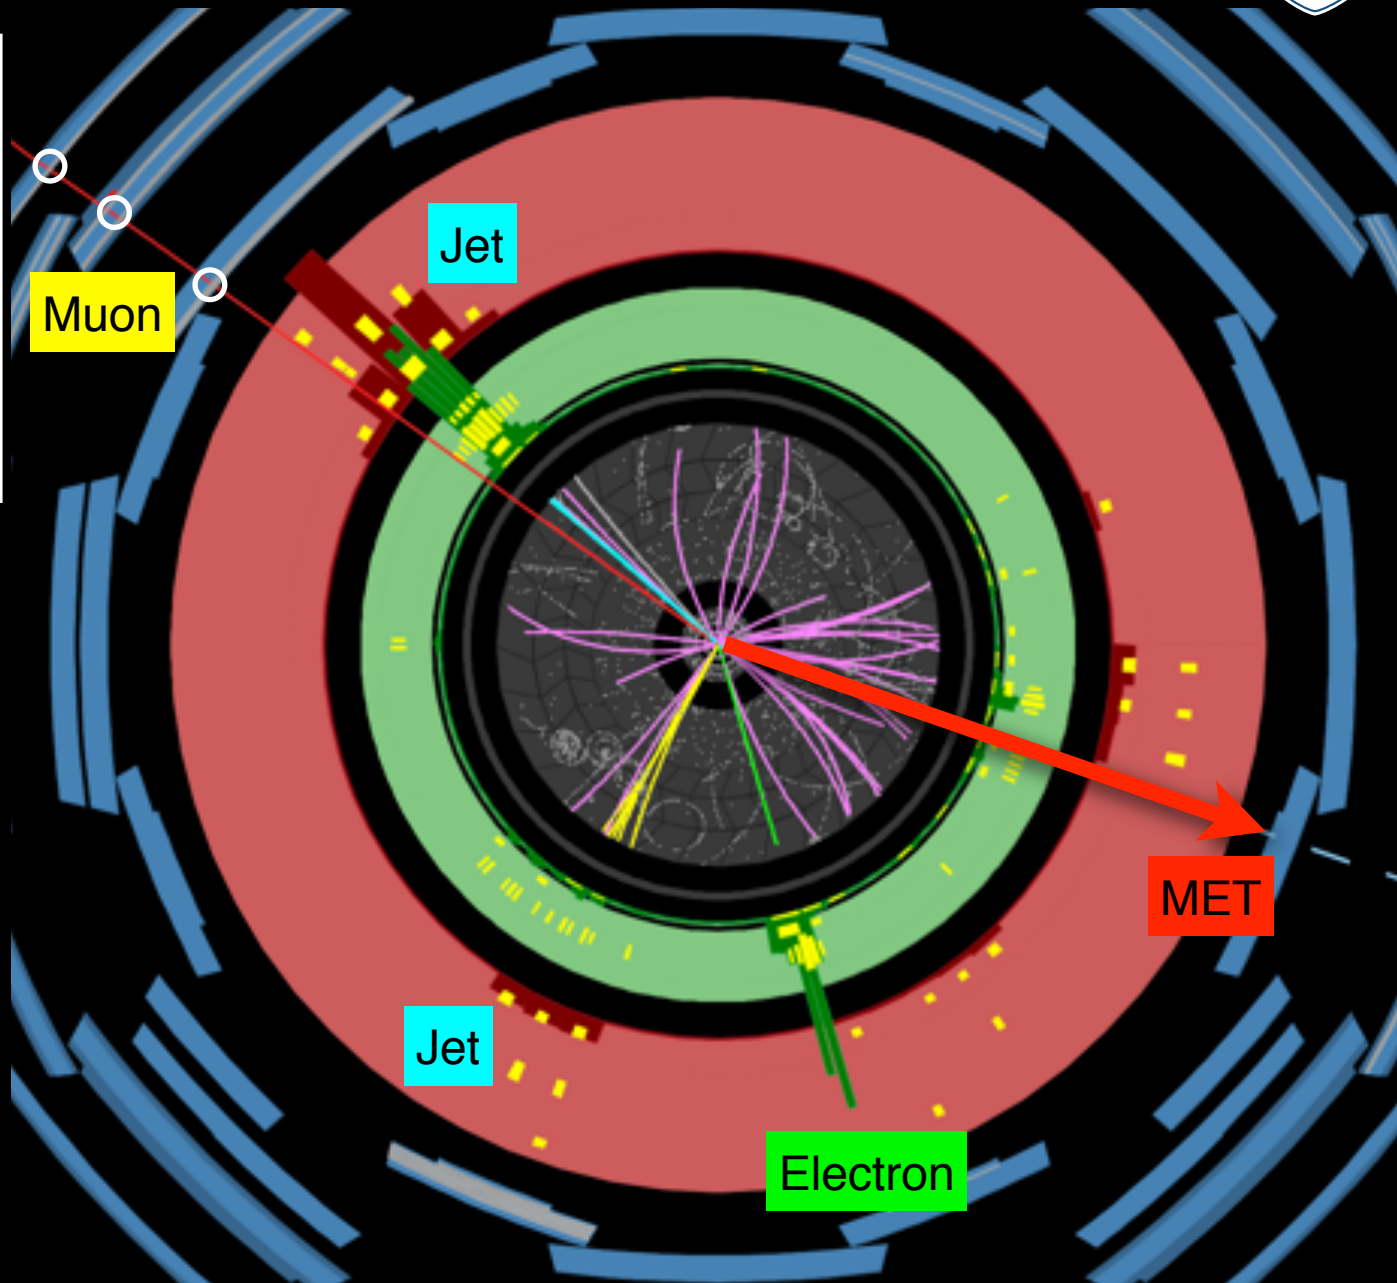

$$t\bar{t} \rightarrow WbWb \rightarrow e\mu bb \text{ MET}$$

Hong

Right: Two b -tag jets, muon, electron, MET

Below: Zoom-in to see two displaced vertices for b -hadron decays

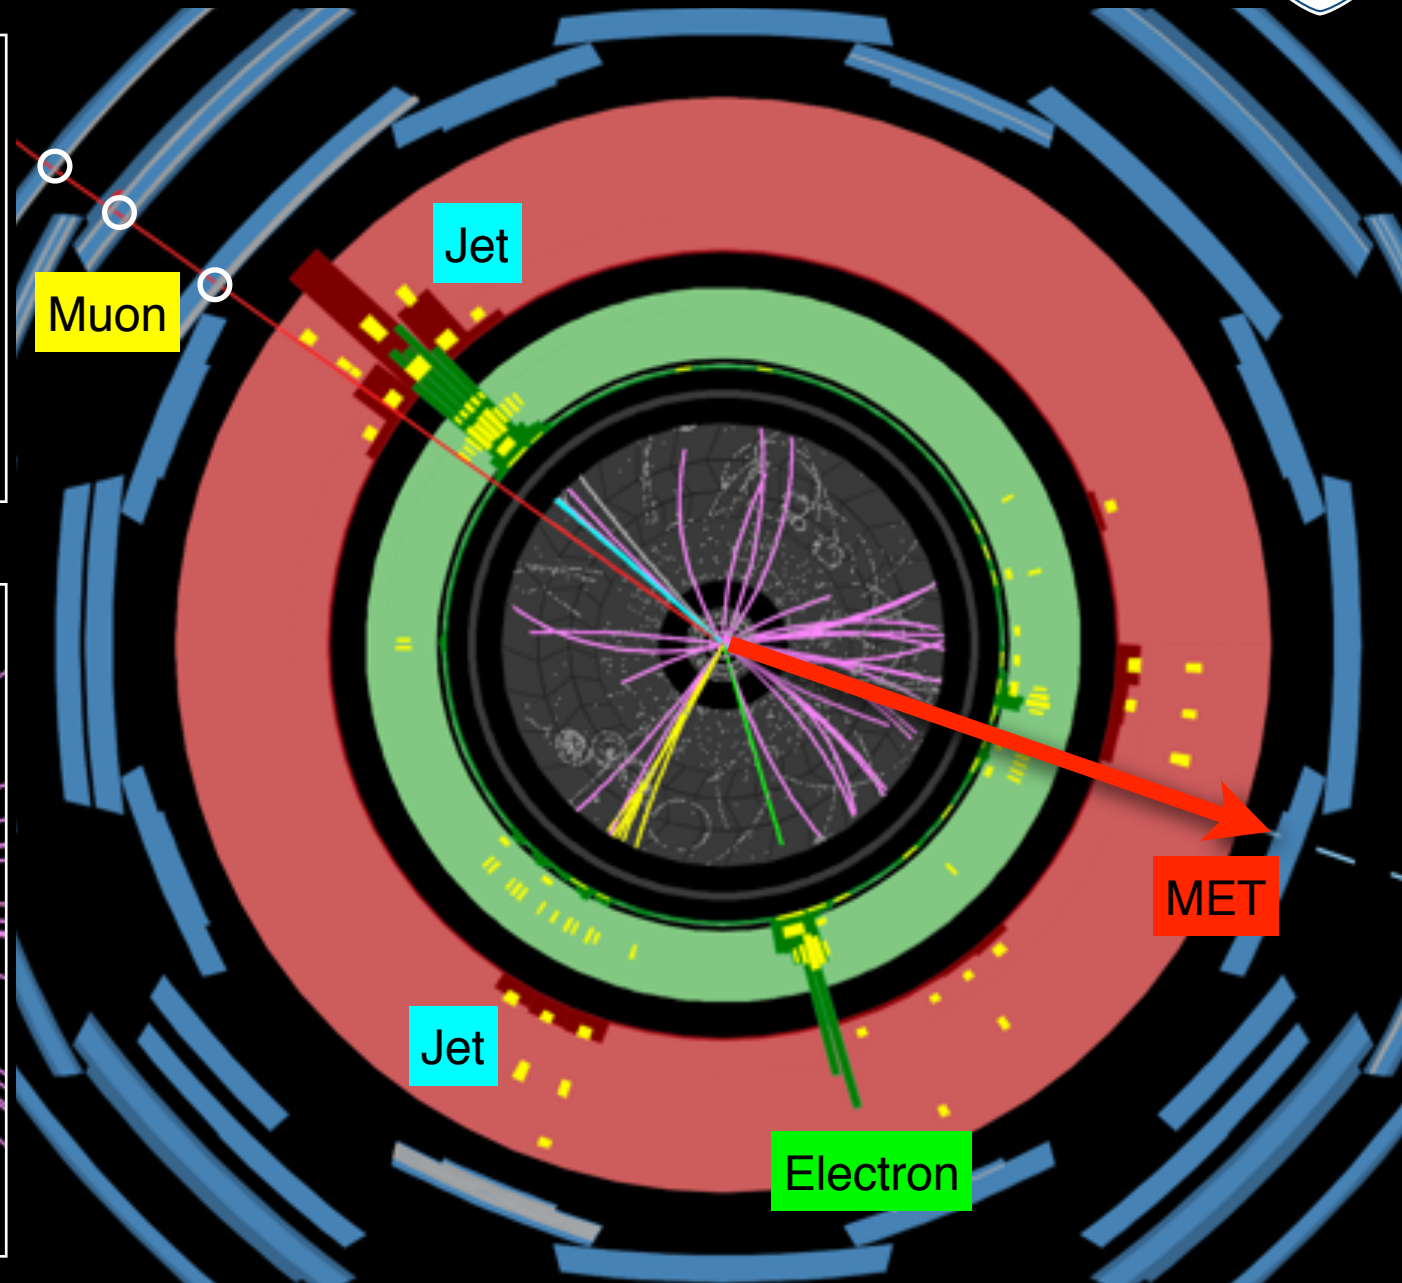

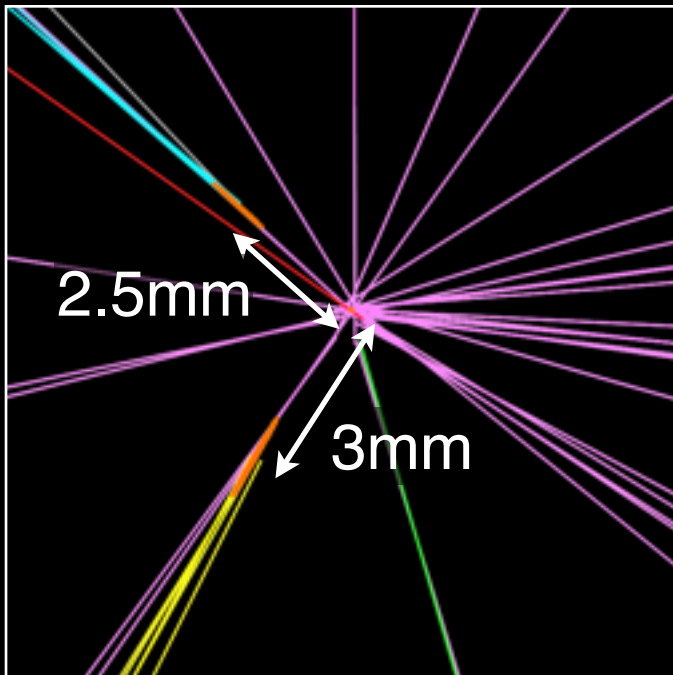

$$t\bar{t} \rightarrow WbWb \rightarrow e\mu bb \text{ MET}$$

Hong

Right: Two b -tag jets, muon, electron, MET

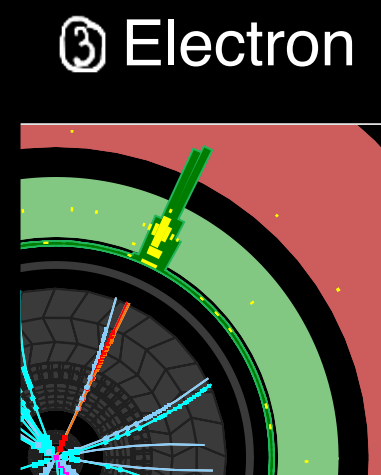

Below: Zoom-in to see two displaced vertices for b -hadron decays

$t\bar{t}$ is a major background to VBF, $H \rightarrow WW^* \rightarrow \ell\nu\ell\nu$

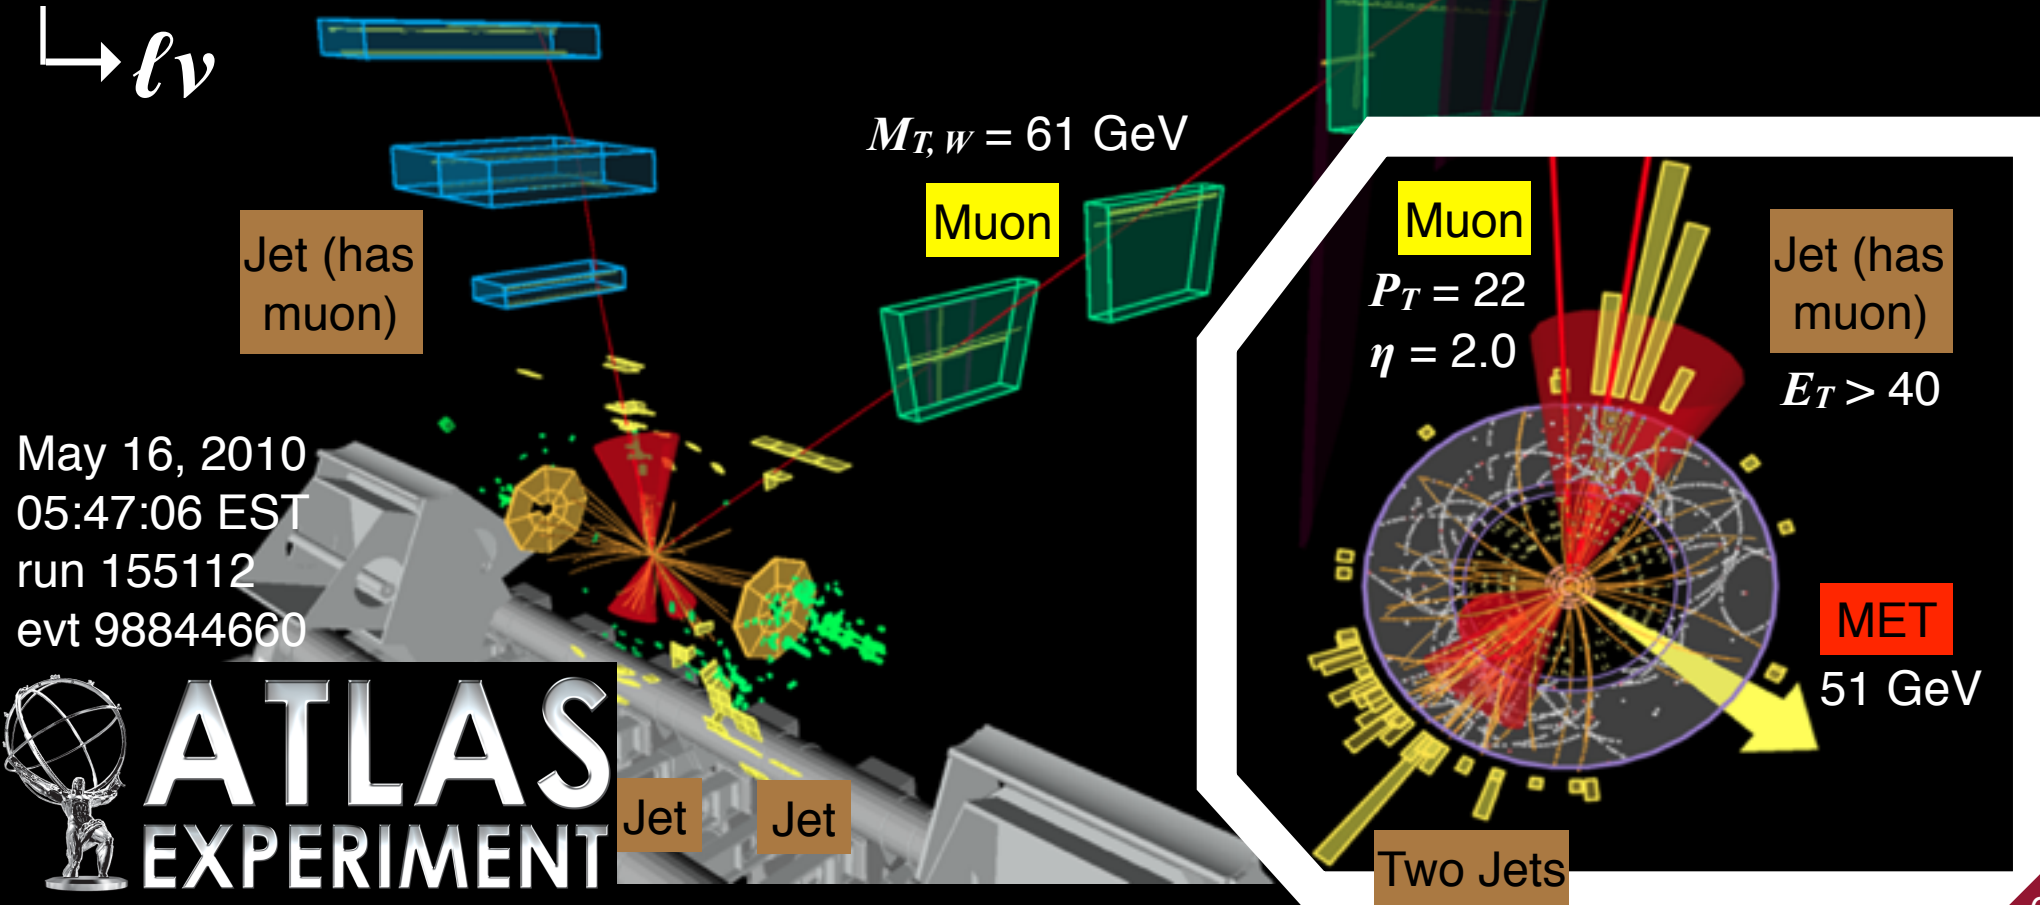

Comparison of

- ① Jet
- ② Tau (3-prong)
- ③ Electron

$Wjjj$ event

$\rightarrow \ell \nu$

May 16, 2010
05:47:06 EST
run 155112
evt 98844660

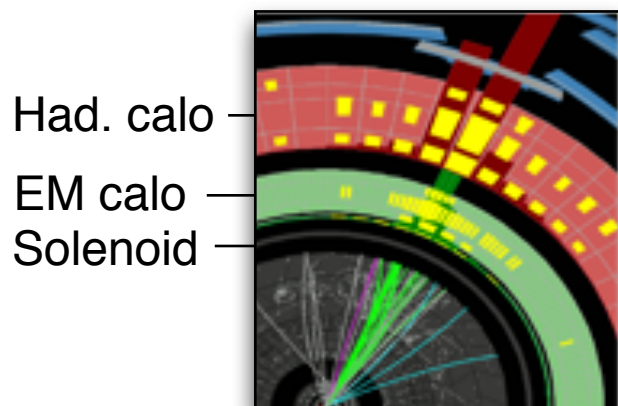

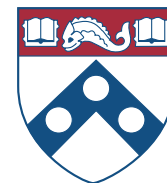

ATLAS
EXPERIMENT

Jets

Calo clusters with anti- k_T , $R = 0.4$

Hong

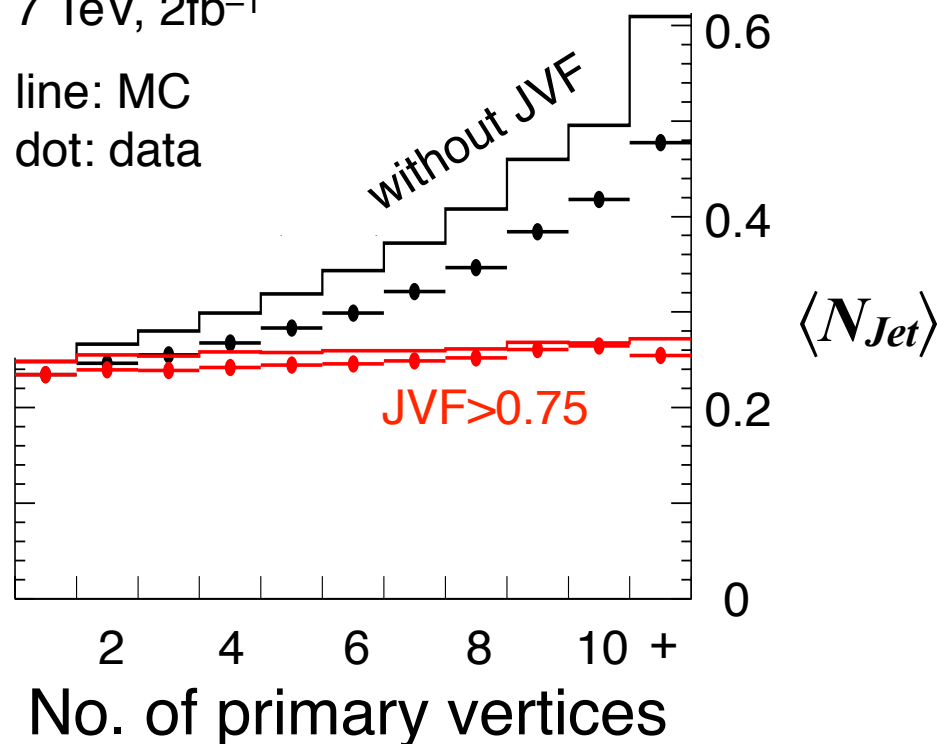

$Z \rightarrow \ell\ell$

ATLAS Prelim.

7 TeV, 2fb^{-1}

line: MC

dot: data

Need two jets for VBF

- Jet Vtx. Fraction kills pile-up jets

Calibrate energy against γ , $Z \rightarrow \ell\ell$

- $\sim 5\%$ error on Jet Energy Scale

Jet energy scale

Hong

Define jet from clusters:

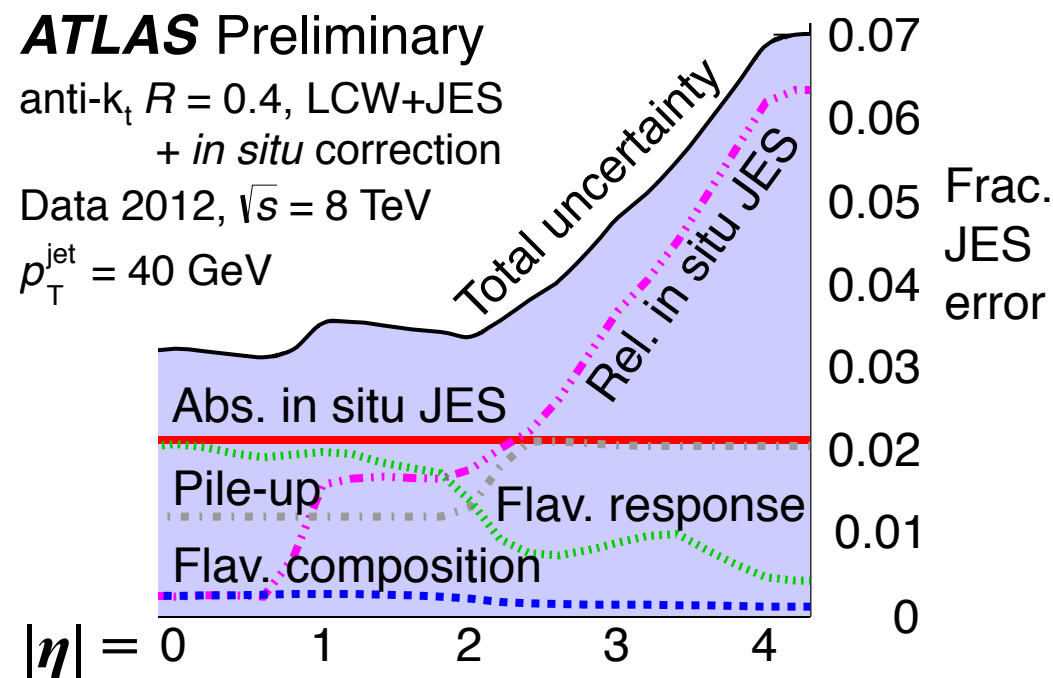

- $P_T > 25$ in tracking vol.

Jet-vertex association to
suppress pile-up (p103-104)

$f_{JVF} > 0.5$ for $P_T < 50$ GeV

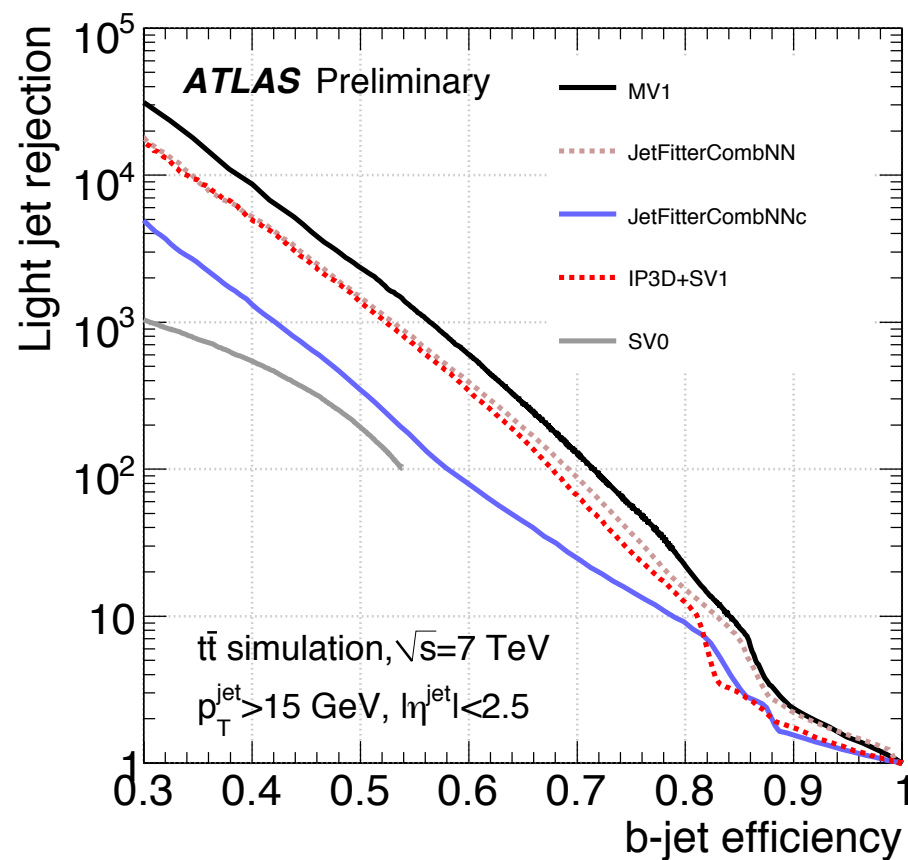

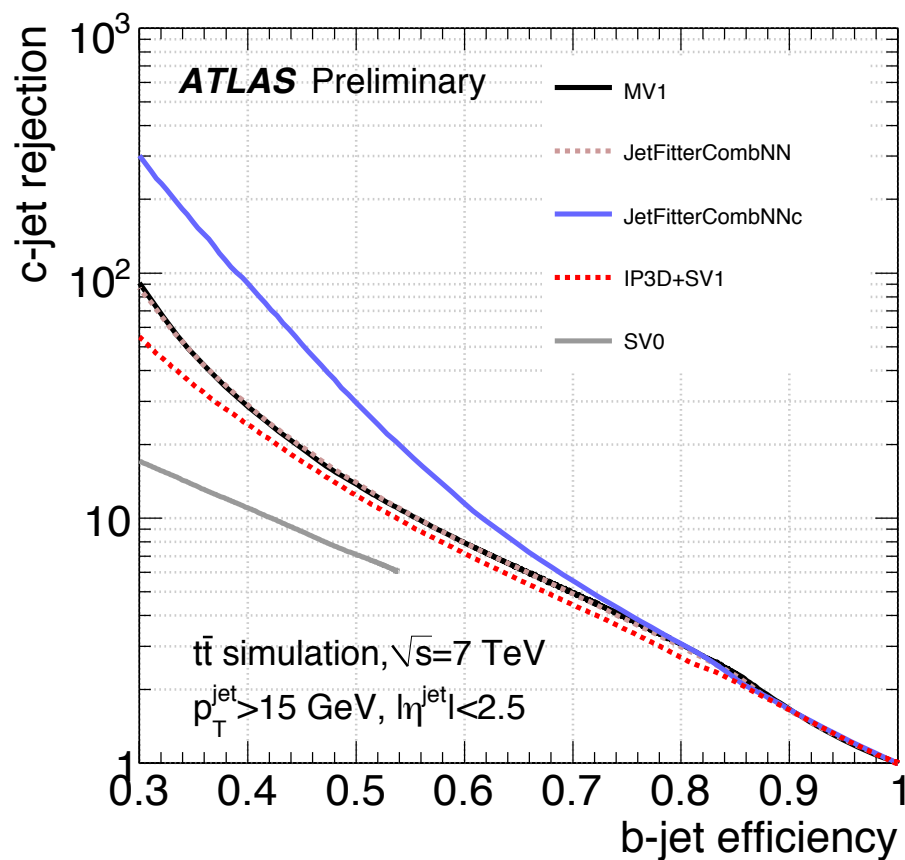

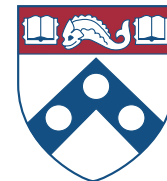

- $P_T > 30$ if forward

$2.4 < |\eta| < 4.5$

b -tagging R.O.C. curves

Hong

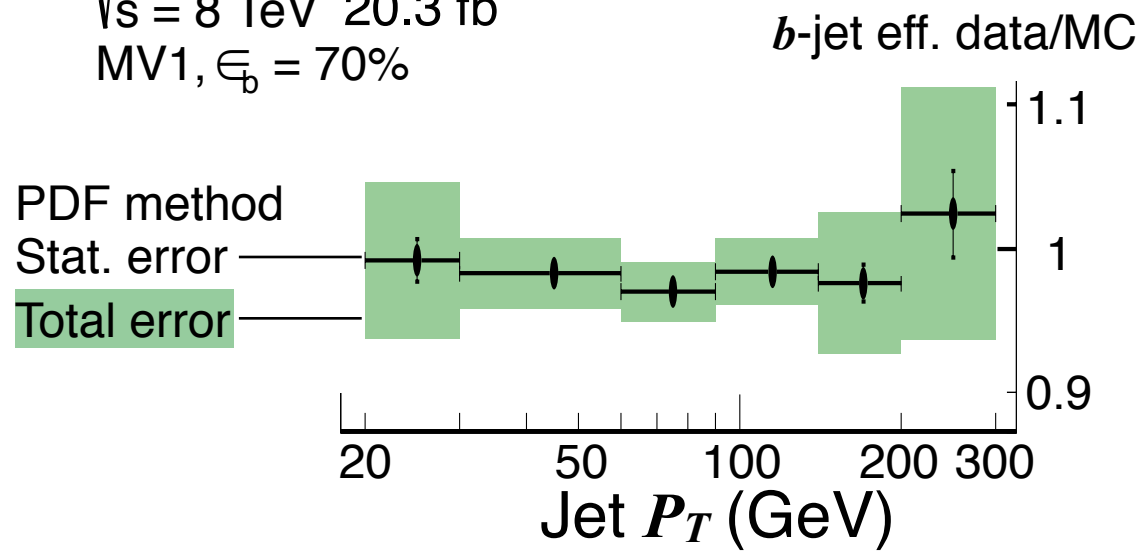

b-tagging scale factor

Hong

ATLAS Preliminary
 $\sqrt{s} = 8 \text{ TeV}$ 20.3 fb^{-1}
MV1, $\epsilon_b = 70\%$

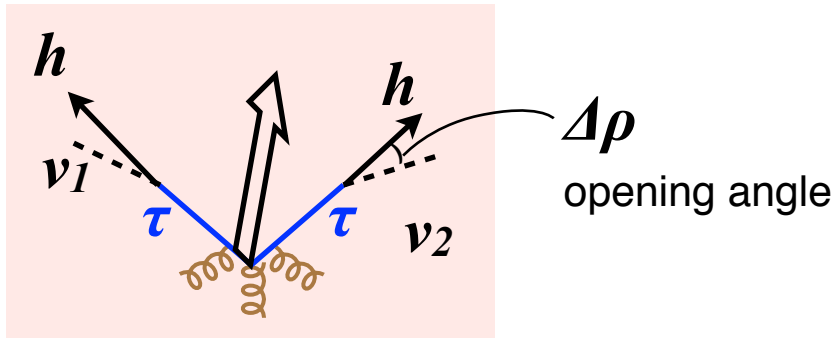

$H \rightarrow \tau\tau$ v. $Z \rightarrow \tau\tau$ separation with $M(\tau\tau)$

Hong

Statement of the problem

- MET measured, not neutrinos

To illustrate, consider $\tau\tau \rightarrow hh\nu_1\nu_2$

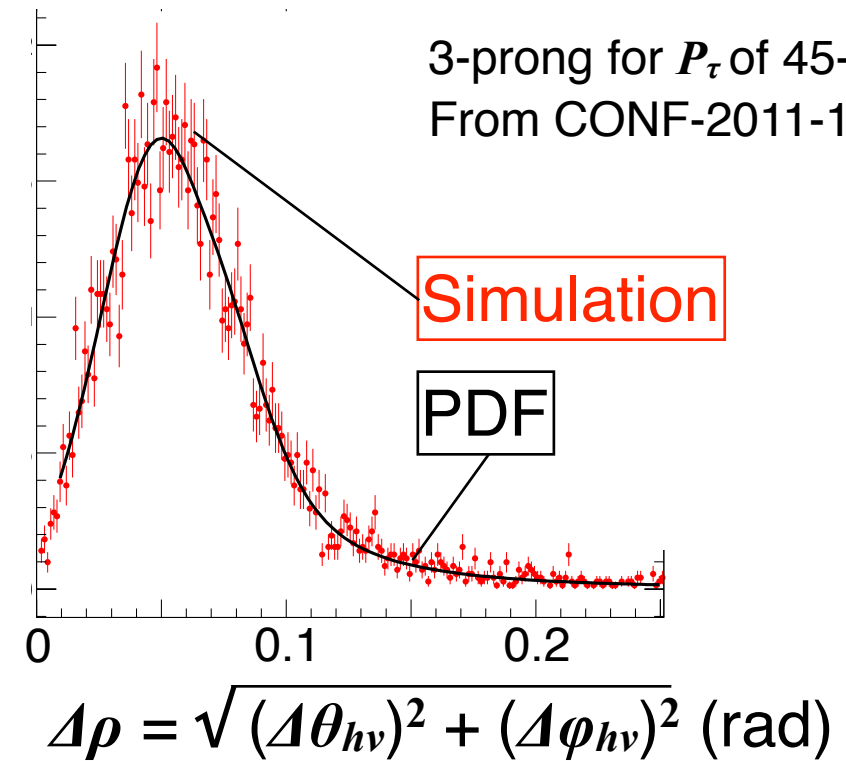

- 6 components for ν_1, ν_2
- 4 eqns. $M(\nu_1 h) = 1.78 \text{ GeV}$
 $M(\nu_2 h) = 1.78 \text{ GeV}$
 $(P_{\nu_1} + P_{\nu_2})_x = MET_x$
 $(P_{\nu_1} + P_{\nu_2})_y = MET_y$
- 2 left. Can parametrize by set($\Delta\rho_1, \Delta\rho_2$)

Arbitrary
scale

$Z \rightarrow \tau\tau \rightarrow \ell h$

ATLAS Simulation

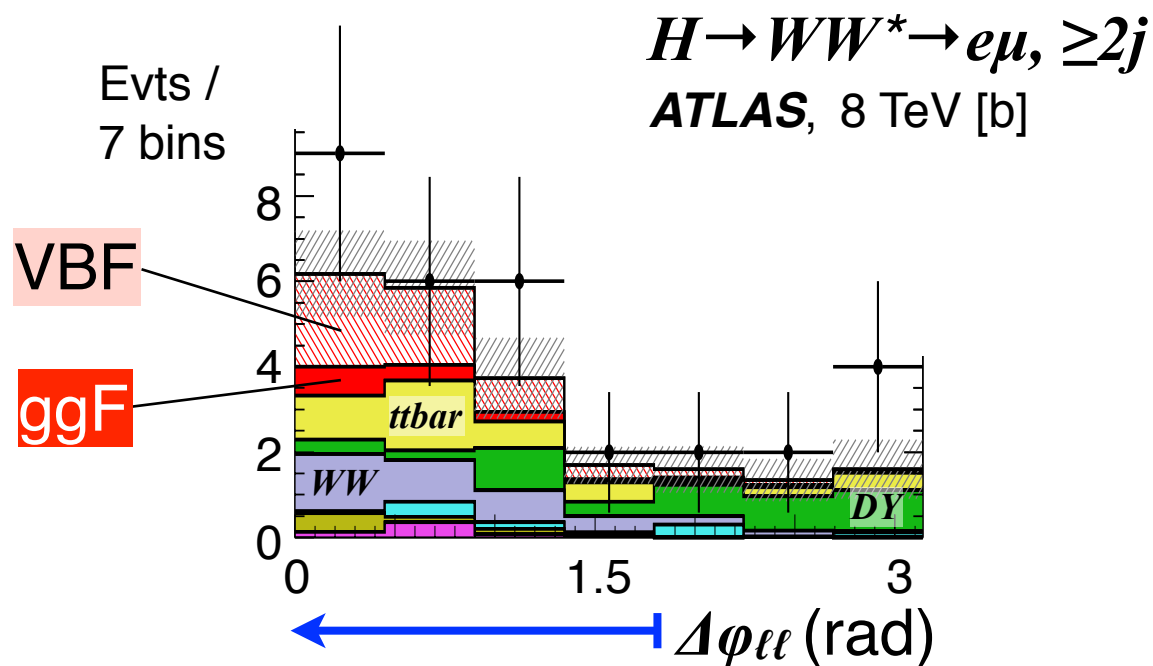

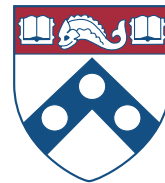

3-prong for P_τ of 45-50
From CONF-2011-132

Hint: Generate $\Delta\rho$ distributions with MC

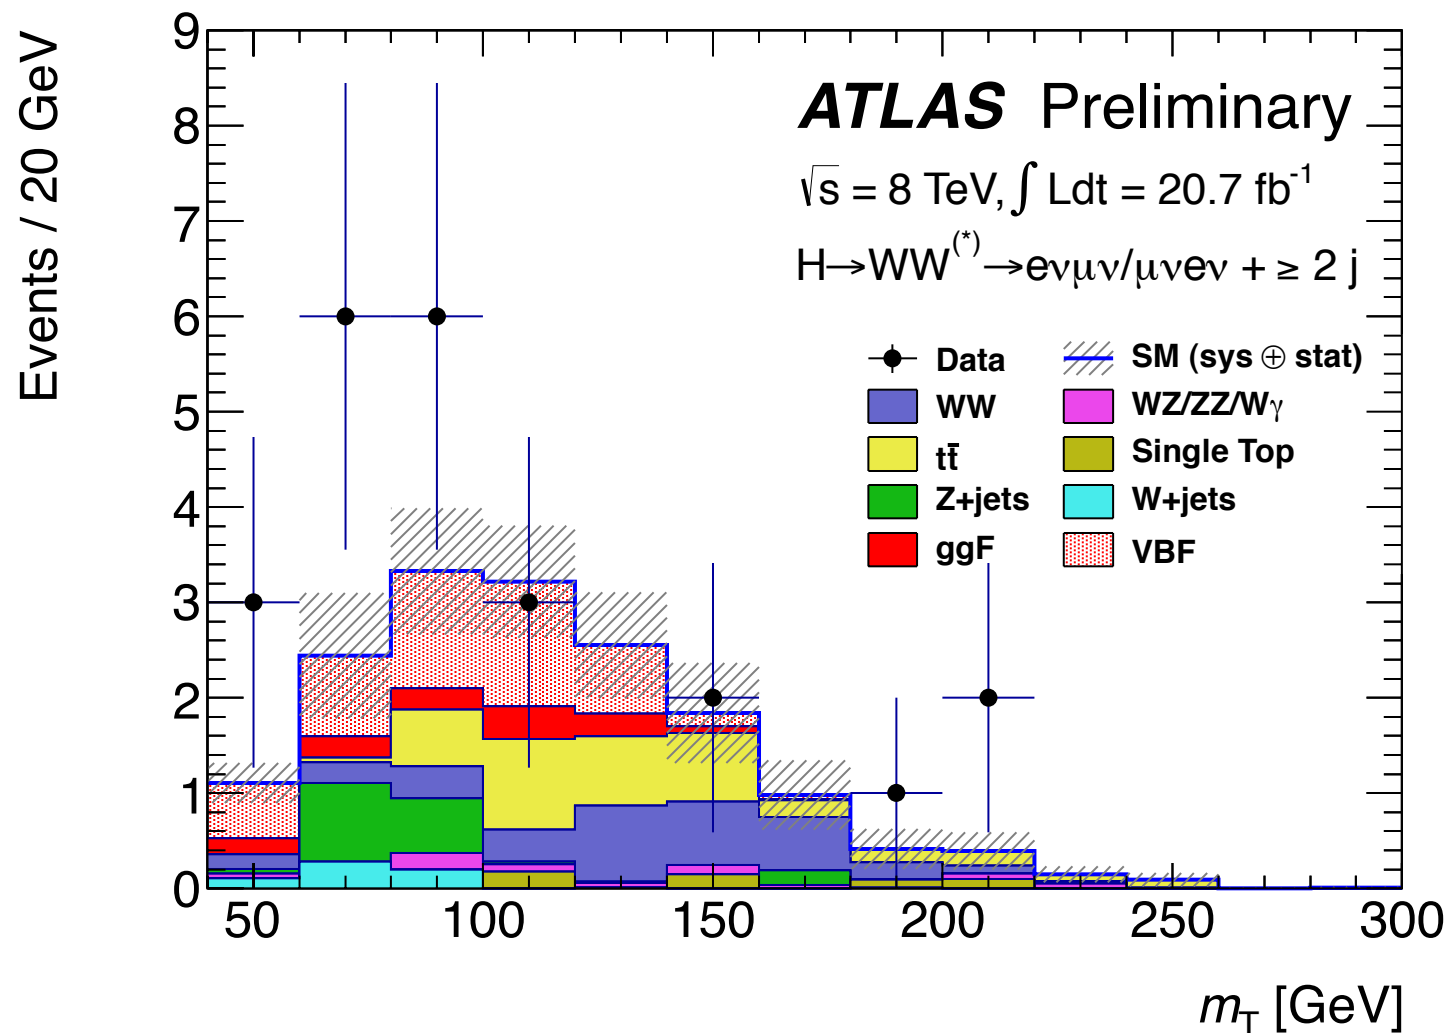

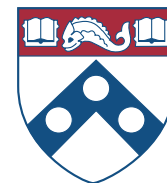

Same as p24, but for $\geq 2j$

Hong

Same as p25 with legends

Hong

Breakdown $H \rightarrow WW^*$

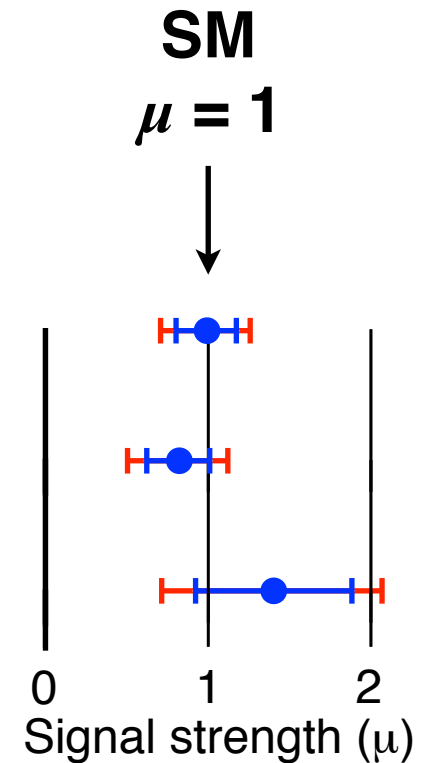

Hong

$$\mu_{\text{Higgs}} = \frac{(\sigma \cdot B)_{\text{Data}}}{(\sigma \cdot B)_{\text{SM}}}$$

		stat.	experimental	theory
Total	0.99	± 0.21	± 0.17	± 0.12
$N_{\text{Jet}} \leq 1$	0.82	± 0.22	± 0.25	
$N_{\text{Jet}} \geq 2$	1.4	± 0.5	± 0.4	

Caveat emptor: The table is using 7 & 8 TeV data at $M_H = 125.5$ GeV combining all the production modes.

Signal significance for HWW is 3.8σ (3.8σ)

observed expected

Considering only VBF HWW is 2.5σ (1.6σ)

VBF significance w.r.t. ggF

Hong

ATLAS

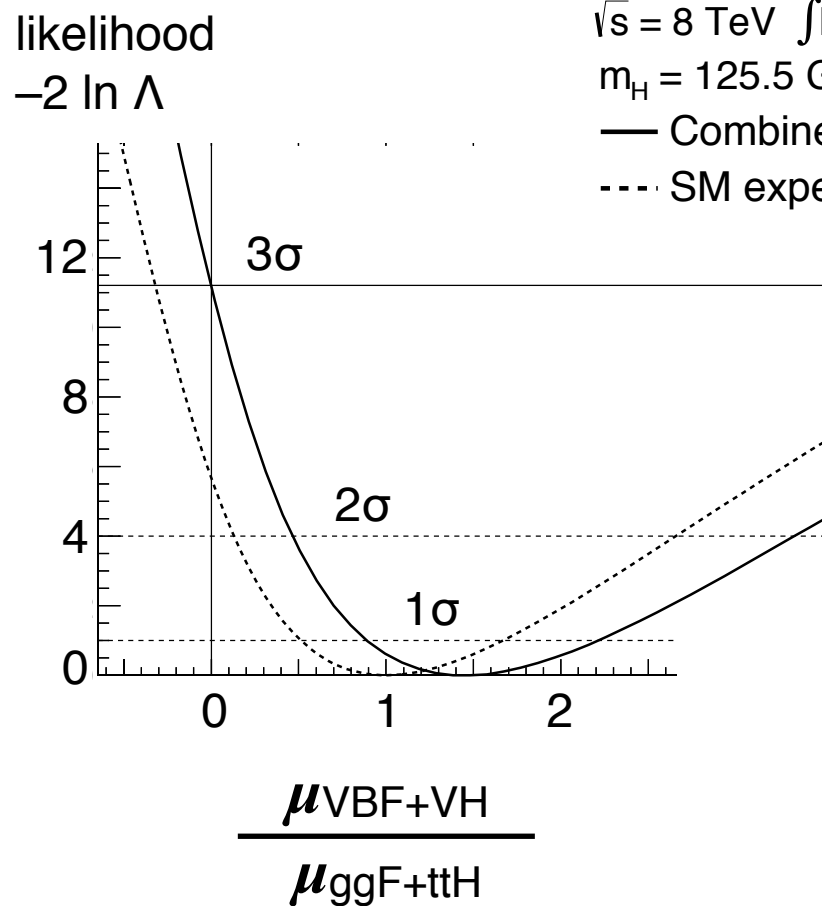

$\sqrt{s} = 7 \text{ TeV}$ $\int \mathcal{L} dt = 4.6\text{-}4.8 \text{ fb}^{-1}$

$\sqrt{s} = 8 \text{ TeV}$ $\int \mathcal{L} dt = 20.7 \text{ fb}^{-1}$

$m_H = 125.5 \text{ GeV}$

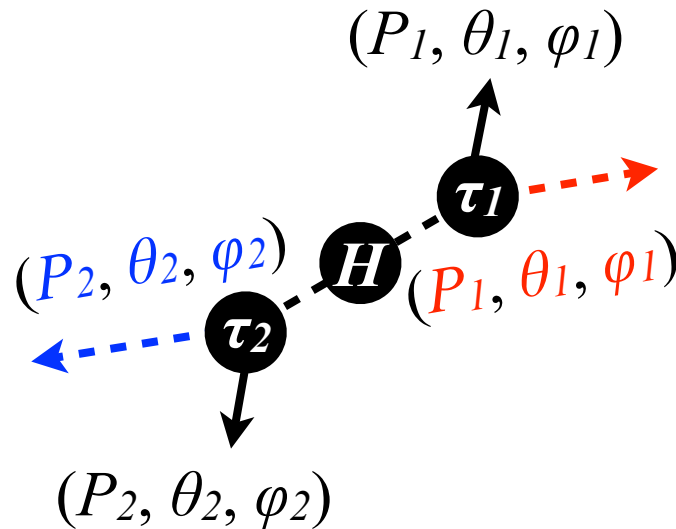

— Combined $H \rightarrow \gamma\gamma, ZZ^*, WW^*$

--- SM expected

$H \rightarrow \tau\tau$ math

Hong

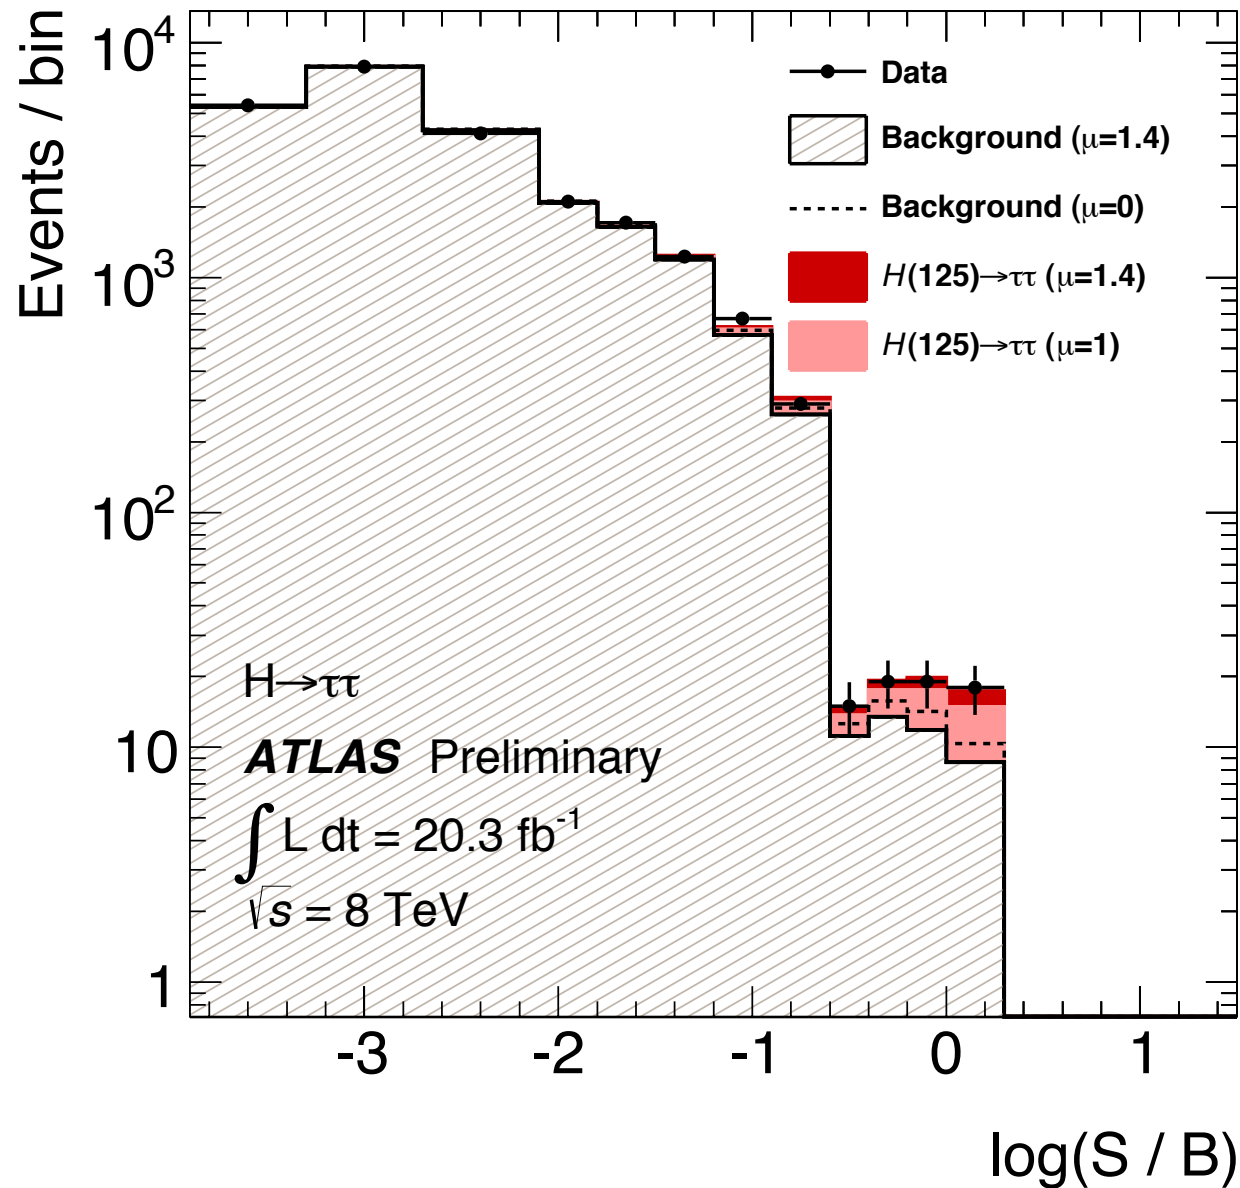

$$\text{MET}_X = (\textcolor{red}{P} \sin \textcolor{red}{\theta}_1) \cdot \cos \textcolor{red}{\phi}_1 + (\textcolor{green}{P} \sin \textcolor{green}{\theta}_2) \cdot \cos \textcolor{green}{\phi}_2$$

$$\text{MET}_Y = (\textcolor{red}{P} \sin \textcolor{red}{\theta}_1) \cdot \sin \textcolor{red}{\phi}_1 + (\textcolor{green}{P} \sin \textcolor{green}{\theta}_2) \cdot \sin \textcolor{green}{\phi}_2$$

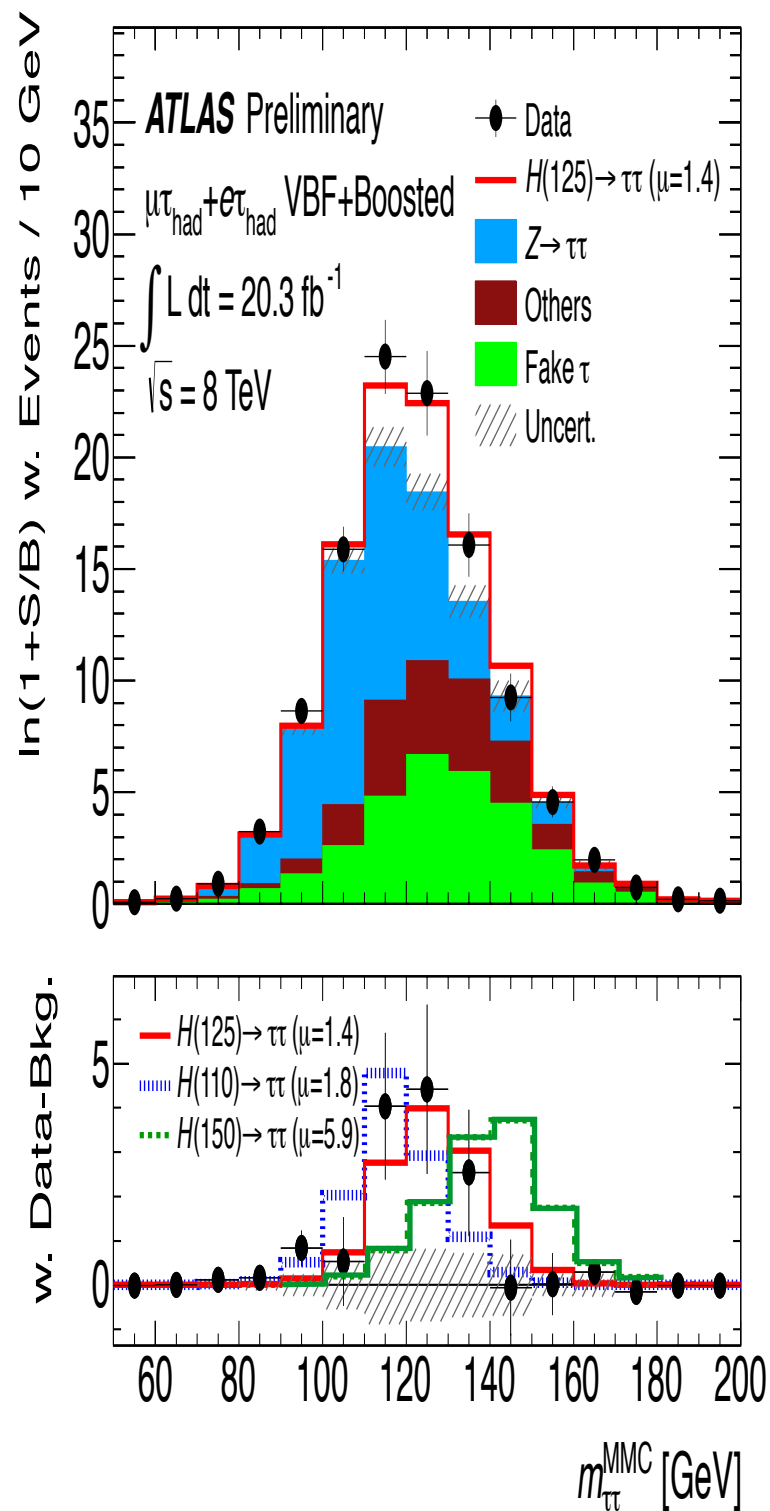

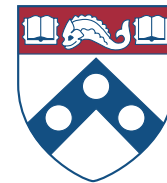

$$M(\tau_1)^2 = 2 \cdot \textcolor{blue}{P} \cdot \textcolor{red}{P} \cdot (1 - \cos(\textcolor{blue}{\theta}_1 - \textcolor{red}{\theta}_1))$$

$$M(\tau_2)^2 = 2 \cdot \textcolor{magenta}{P} \cdot \textcolor{green}{P} \cdot (1 - \cos(\textcolor{magenta}{\theta}_2 - \textcolor{green}{\theta}_2))$$

Same as p41, but for combined channels

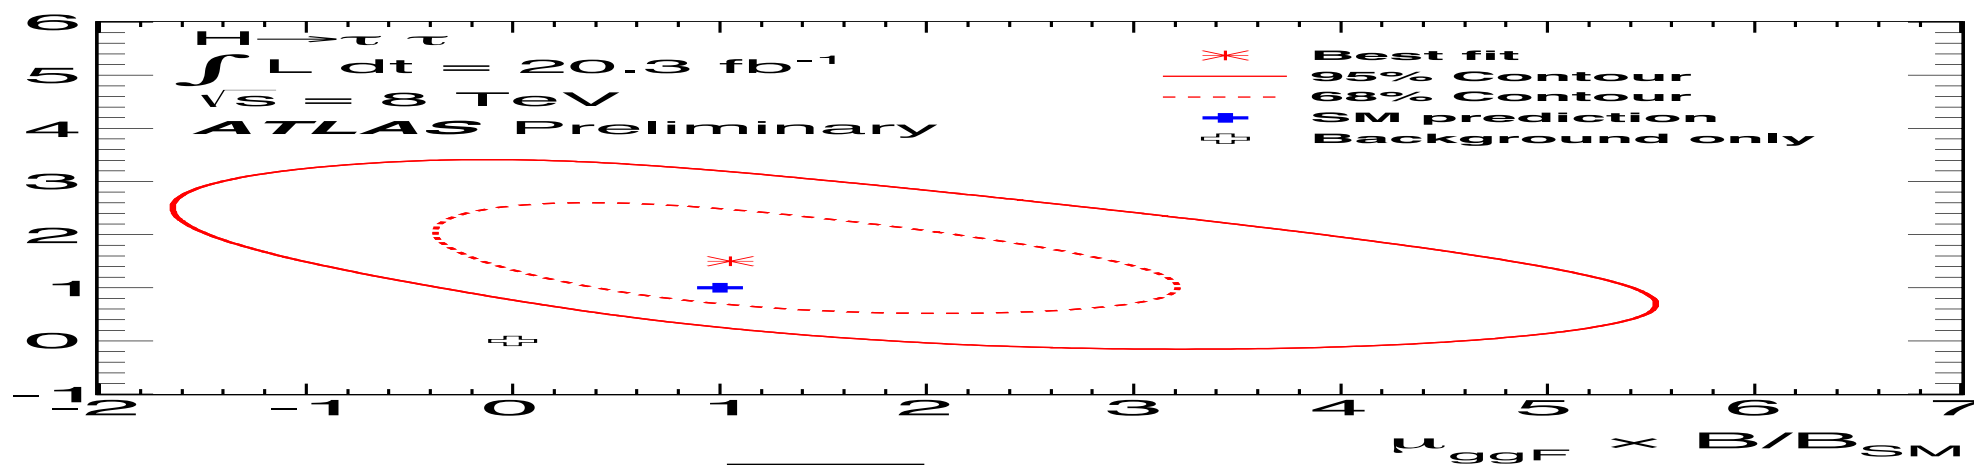

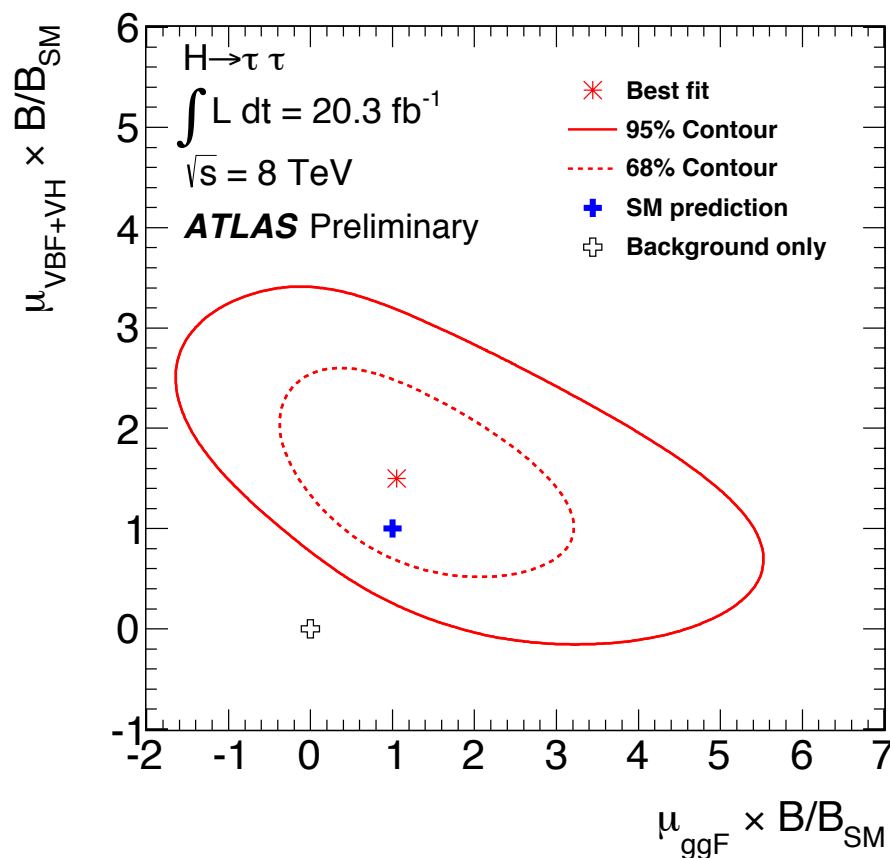

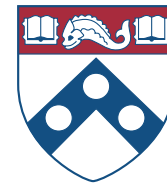

Same as p42 with legends

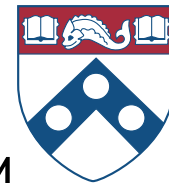

Same as p43, but stand-alone

Hong

Future projections

Hong
